Richard Lewontin is undoubtedly one of the most distinguished evolutionary biologists of our time. He has contributed to science not only by his own work on evolutionary theory and molecular variation and by his influence on the many young scientists who have worked with him but also by asking us to think about the relationships between the science we do and that world we do it in. Sciences in general and the life sciences in particular need their own critic and Lewontin has been an untiring critic of science and its relevance to society. This collection of essays first published in 2000 was produced in honour of Lewontin's 65th birthday. The volume has a comprehensive coverage of modern evolutionary genetics from molecules to morphology by a group of star authors including his students and colleagues. The areas covered are the mathematical and molecular foundations of population genetics, molecular variation and evolution, selection and genetic polymorphisms, linkage and breeding system evolution, quantitative genetics and phenotypic evolution, gene flow and population structure, speciation, behaviour and ecology. The volume brings out the central role of evolutionary genetics in all aspects of its connection to evolutionary biology and is a must for all graduate students and researchers in evolutionary biology.

*Evolution, Genetics and Eugenics* Horatio Hackett Newman, 1925      **The Science of Evolution** William D. Stansfield, 1977      **Textbook of Evolution and Genetics** Arthur Ward Lindsey, 1929      [Elements of Evolutionary Genetics](#) Brian Charlesworth, Deborah Charlesworth, 2010-02-03. This textbook shows readers how models of the genetic processes involved in evolution are made, including natural selection, migration, mutation and genetic drift in finite populations, and how the models are used to interpret classical and molecular genetic data. The material is intended for advanced level undergraduate courses in genetics and evolutionary biology, graduate students in evolutionary biology and human genetics, and researchers in related fields who wish to learn evolutionary genetics. The topics covered include genetic variation, DNA sequence variability and its measurement, the different types of natural selection and their effects, e.g. the maintenance of variation, directional selection and adaptation, the interactions between selection and mutation or migration, the description and analysis of variation at multiple sites in the genome, genetic drift and the effects of spatial structure.

**Evolutionary Biology** Arthur Dendy, 1912      *Biology Textbooks* 1990, 1990      Principles of Animal Biology Aaron Franklin Shull, 1920      *Evolutionary Genetics* Charles W. Fox, Jason B. Wolf, 2006-04-27 Charles Fox and Jason Wolf have brought together leading researchers to produce a cutting edge primer introducing readers to the major concepts in modern evolutionary genetics. This book spans the continuum of scale from studies of DNA sequence evolution through proteins and development to multivariate phenotypic evolution and the continuum of time from ancient events that lead to current species diversity to the rapid evolution seen over relatively short time scales in experimental evolution studies. Chapters are accessible to an audience lacking extensive background in evolutionary genetics but also current and in depth enough to be of value to established researchers in evolution biology.
