

Stereochemistry

You might think that compounds of the same molecular formulas are the same, but that is always not true. There are two reasons for that: the first is that atoms can be arranged differently, the second is that atoms can orient differently in space so that the molecules acquire different 3D structures [configurations]. Look at these two examples:

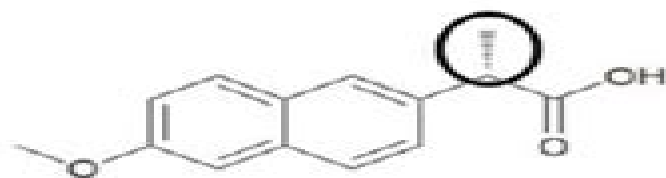

Methoxymethane
Boiling point = -23°C

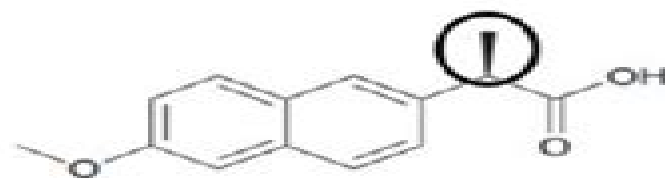

Ethanol
Boiling point = 78.4°C

Figure 1

(*S*)-Naproxen

(*R*)-Naproxen

Figure 2

In the first examples both compounds have the formula $\text{C}_3\text{H}_8\text{O}$, but the compound on the left is an ether while the right one is an alcohol and both compounds exhibit different physical and chemical properties.

In the second example atoms have the same connectivity but they differ in their spatial arrangement. The *S*- configuration is an anti-inflammatory drug while the *R*-configuration is a liver toxin. The difference is that the methyl group is drawn dashed while that in the *R*-configuration is drawn as a wedge. Organic chemists usually use dashed lines to show that the

International Research Centers Directory, 2009 The Birth of the 3rd Dimension in Chemistry Arthur Greenberg, David E. Lewis, 2025-12-19 This contributed volume is based on presentations made at the 2024 Symposium on the sesquicentennial of the independent proposals of the tetrahedral carbon by van t Hoff and Le Bel 1874 presented to the Division of the History of Chemistry of the American Chemical Society in March 2024 In 1874 the Dutch chemist Jacobus Henricus van t Hoff 1852 1911 and the French chemist Joseph Achille Le Bel 1847 1930 independently proposed that the phenomenon of optical activity could be rationalized on the basis of non superimposable mirror image molecules in particular the tetrahedral carbon atom The book features chapters dedicated to the life and work of Le Bel and the history of stereochemistry The expansion of the van t Hoff Le Bel theory to elements beyond carbon such as metals and chiral centers

based on sulfur and selenium is also explored. Additionally, the book discusses the visualization of organic molecules in three dimensions through molecular models, the limits of bonding and stereochemistry in organic molecules, and the role of crystallography in stereochemistry development. Specific topics include hydrocarbons with severely distorted geometry, the quantum chemical revolution, the effects of substituents on tetrahedral carbons, the Walden inversion, and the Fischer elucidation of monosaccharide configurations. A chapter by Kahr and Rossi includes the only English translation of the undergraduate thesis of the world-renowned author Primo Levi, a Jewish Italian-born chemist and Holocaust survivor, and provides historical and scientific context. The book also examines the public celebration of stereochemistry through postage stamps. This title offers a comprehensive overview of the evolution and significance of stereochemistry in both chemistry and scientific thought, serving as a valuable resource for students and researchers interested in the history of chemistry topics.
