

I. Definitions, Vocab

A hyperbola is the set of all points in the plane in which the difference of the distances from two distinct fixed points, called foci, is constant. Like Ellipses, they can have a vertical or horizontal orientation.

As the graphs on the previous slide show, a hyperbola contains two symmetrical parts called branches.

A hyperbola also has two axes of symmetry. The transverse axis of symmetry contains the vertices and, if it were extended, the foci of the hyperbola. The vertices of a hyperbola are the endpoints of the transverse axis.

The conjugate axis of symmetry separates the two branches of the hyperbola. The co-vertices of a hyperbola are the endpoints of the conjugate axis. The transverse axis is not always longer than the conjugate axis.

The standard form of the equation of a hyperbola depends on whether the hyperbola's transverse axis is horizontal or vertical.

The relationship $a^2 + b^2 = c^2$ exists, where a is the length of the semitransverse axis, b is the length of the conjugate axis, and c is the distance between the center and the foci. For hyperbolas, the transverse axis is not always larger than the conjugate axis.
