Maziasz,John P. Hayes,2012-12-06 The layout of an integrated circuit IC is the process of assigning geometric shape size and position to the components transistors and connections used in its fabrication Since the number of components in modern ICs is enormous computer aided design CAD programs are required to automate the difficult layout process Prior CAD methods are inexact or limited in scope and produce layouts whose area and consequently manufacturing costs are larger than necessary This book addresses the problem of minimizing exactly the layout area of an important class of basic IC structures called CMOS cells First we precisely define the possible goals in area minimization for such cells namely width and height minimization with allowance for area reducing reordering of transistors We reformulate the layout problem in terms of a graph model and develop new graph theoretic concepts that completely characterize the fundamental area minimization problems for series parallel and nonseries parallel circuits These concepts lead to practical algorithms that solve all the basic layout minimization problems exactly both for a single cell and for a one dimensional array of such cells Although a few of these layout problems have been solved or partially solved previously we present here the first complete solutions to all the problems of interest      Electricity and Its Application to Automotive Vehicles Paul McDowell Stone,1923      **Principles of**
