Zych, 2017-02-06 This thesis introduces a new theoretical tool to explore the notion of time and temporal order in quantum
mechanics the relativistic quantum clock framework It proposes novel thought experiments showing that proper time can
display quantum features e g when a clock runs different proper times in superposition The resulting new physical effects
can be tested in near future laboratory experiments with atoms molecules and photons as clocks The notion of time holds the
key to the regime where quantum theory and general relativity overlap which has not been directly tested yet and remains
largely unexplored by the theory The framework also applies to scenarios in which causal relations between events become
non classical and which were previously considered impossible to address without refuting quantum theory The relativistic
quantum clock framework offers new insights into the foundations of quantum theory and general relativity **Hidden**
