

THE RECTUM

CHAPTER

71

LEARNING OBJECTIVES

- To understand the anatomy of the rectum and its relationship to surgical disease and its treatment
- To understand the pathology, clinical presentation, investigation, differential diagnosis and treatment of diseases that affect the rectum
- To appreciate that carcinoma of the rectum is common and its symptoms are similar to benign disease, and hence patients with such symptoms must be carefully evaluated

ANATOMY

Surgical anatomy (Box 71.1)

The rectum has an ill-defined anatomical beginning, but surgically the rectosigmoid junction lies opposite the sacral promontory. From here the rectum follows the curve of the sacrum, to end at the ano-rectal junction. At this point, the puborectalis muscle encircles the posterior and lateral aspects of the junction, creating the anorectal angle (normally 120°). The rectum has three lateral curvatures: the upper and lower are convex to the right, and the middle convex to the left. On the mucosal (luminal) aspect, these three curves are marked by semicircular folds (Houston's valves) (Fig. 71.1). That part of the rectum that lies below the middle valve has a much wider diameter than the upper third and is known as the ampulla of the rectum.

The adult rectum is approximately 15–20 cm in length and is conveniently divided into three equal parts: the upper third, which is mobile and has a peritoneal coat except near to the middle third where the peritoneum covers only the anterior and part of the lateral surfaces; the middle third, which is the widest part of the rectum and is confined within the diameter of the bony pelvis; and the lower third, which lies within the muscular floor of the pelvis and has important relations to fascial layers.

The lowest part of the rectum is separated by a fascial condensation – Denonvilliers' fascia – from the prostate in front, and

Figure 71.1 Houston's valves as seen through a sigmoidoscope.

behind by another fascial layer – Waldeyer's fascia – from the coccyx and last two sacral vertebrae (Table 71.1). These fascial layers are surgically important as they are a barrier to malignant penetration, and are valuable guides at operation.

Blood supply

The superior rectal artery is the direct continuation of the inferior mesenteric artery and is the main arterial supply of the rectum. Opposite the third sacral vertebra, the artery divides again behind the lower third of the rectum into an anterior and a posterior branch. The arteries and their accompanying lymphatics are kept applied to the back of the rectum by dense connective tissue (the mesorectum or 'rectal fascia').

The middle rectal artery arises on each side from the internal iliac artery (Fig. 71.2) and passes to the rectum in the lateral ligaments. It is usually small and breaks up into several terminal branches.

**Box 71.1****Anatomy of the rectum**

- The rectum measures approximately 20 cm in length
- It is divided into lower, middle and upper thirds
- The blood supply consists of inferior, middle and superior rectal vessels
- Although the lymphatic drainage follows the blood supply, the principal route is upwards along the superior rectal vessels to the para-aortic nodes

John Houston [1802–1845, Physician, City of Dublin Hospital and Lecturer in Surgery, Dublin, Ireland.
Charles Pierre Denonvilliers [1808–1875, Professor of Anatomy and later of Surgery, Paris, France.

Heinrich Waldeyer, Qualified Waldeyer-Harts [1826–1901, Professor of Pathological Anatomy, Berlin, Germany.
