

CHAPTER REVIEW

DATE

MO TU WE TH FR SA SU

CHAPTER'S SUBJECT

Mitosis, the process driving cell division for growth and repair.

KEY POINTS

- Interphase Preparation: Cells duplicate DNA in G2 for mitosis.
- Prophase: Chromosomes condense, nuclear envelope breaks, spindle fibers form.
- Metaphase: Chromosomes align at the cell's center for even distribution.
- Anaphase: Sister chromatids separate, moving to opposite poles.
- Telophase & Cytokinesis: Chromatids reach poles, nuclear envelopes reform, and cell divides into two identical cells.

GRAPHICS

1. Prophase: A centriole outside the nucleus divides. The nucleus's threadlike material coils into visible chromosomes, and the nuclear membrane vanishes. Centrioles extend strands in all directions, forming the spindle as strands join from each centriole.

2. Metaphase: Chromosomes align at the cell's center for distribution.

3. Anaphase: The chromatids separate, moving to opposite ends of the cell, transforming into chromosomes. Now, a complete set of chromosomes migrated toward each centriole.

SUMMARY

Mitosis ensures accurate cell division, from DNA duplication in interphase to the distinct stages of Prophase, Metaphase, Anaphase, and the concluding Telophase with Cytokinesis, the process maintaining genetic integrity, resulting in two identical daughter cells.

VOCAB

Mitosis: The process of cell division ensuring accurate distribution of genetic material.

Chromosomes: Thread-like structures containing genetic information.

Spindle fibers: Microscopic structures aiding chromosome movement.
