

of control valve diaphragm. The diaphragm plate contains 4 bleed holes to bleed air into the vacuum chamber when backpressure valve is in open position. See Fig. 8.

Verify EGR valve is present and not modified or improperly damaged. Examine thermal vacuum switches, pressure transducers, speed switches, etc., (if applicable) as set by parent or modified. Examine vacuum line(s) to EGR valve is not plugged.

NOTE: This article is provided for general information only. Not all information applies to all makes and models. For more complete information, see appropriate article (s) in the **ENGINE PERFORMANCE** Section.

This type has the same function as the positive BPBGR valve except valve is designed to open with a negative exhaust backpressure. The control valve spring in the transducer is placed on the bottom side of the diaphragm. See Fig. 10.

When ported vacuum is applied to the main vacuum chamber, partially opening the valve, the vacuum signal from the manifold side (reduced by exhaust backpressure) is transmitted to the bottom stem of the valve. See Fig. 10. This matches the signal to act on the diaphragm, providing a specific flow. Thus, the EGR flow is a constant percentage of engine airflow.

Verify EGR valve is present and not modified or improperly damaged. Examine thermal vacuum switches,

pressure transducers, speed switches, etc., (if applicable) as set by parent or modified. Examine vacuum line(s) to EGR valve is not plugged.
