Ibn al-Haytham's Theory of Conics, Geometrical Constructions and Practical Geometry Roshdi Rashed, 2013-06-26 Theory of Conics Geometrical Constructions and Practical Geometry A History of Arabic Sciences and Mathematics Volume 3 provides a unique primary source on the history and philosophy of mathematics and science from the mediaeval Arab world The present text is complemented by two preceding volumes of A History of Arabic Sciences and Mathematics which focused on founding figures and commentators in the ninth and tenth centuries and the historical and epistemological development of infinitesimal mathematics as it became clearly articulated in the oeuvre of Ibn al Haytham This volume examines the increasing tendency after the ninth century to explain mathematical problems inherited from Greek times using the theory of conics Roshdi Rashed argues that Ibn al Haytham completes the transformation of this area of activity into a part of geometry concerned with geometrical constructions dealing not only with the metrical properties of conic sections but with ways of drawing them and properties of their position and shape Including extensive commentary from one of world's foremost authorities on the subject this book contributes a more informed and balanced understanding of the internal currents of the history of mathematics and the exact sciences in Islam and of its adaptive interpretation and assimilation in the European context This fundamental text will appeal to historians of ideas epistemologists and mathematicians at the most advanced levels of research

Understanding finding or even deciding on the existence of real solutions to a system of equations is a difficult problem with

many applications outside of mathematics While it is hopeless to expect much in general we know a surprising amount about these questions for systems which possess additional structure often coming from geometry This book focuses on equations from toric varieties and Grassmannians Not only is much known about these but such equations are common in applications There are three main themes upper bounds on the number of real solutions lower bounds on the number of real solutions and geometric problems that can have all solutions be real The book begins with an overview giving background on real solutions to univariate polynomials and the geometry of sparse polynomial systems The first half of the book concludes with fewnomial upper bounds and with lower bounds to sparse polynomial systems The second half of the book begins by sampling some geometric problems for which all solutions can be real before devoting the last five chapters to the Shapiro Conjecture in which the relevant polynomial systems have only real solutions
