Introduction: Balancing

- Write the equation for the reaction of sodium and chlorine (chlorine from sodium chloride).

- Write the equation for the reaction of sodium oxide and sodium chloride to produce sodium chloride and sodium metal.

Information: Subscripts and Coefficients

It is important to understand that atoms are never really "destroyed" or "created". For example, in Cl_2 there are two chlorine atoms and in $NaCl$ there are two chlorine atoms (one bonded to one sodium).

A coefficient tells you how many molecules (molecules don't say, but we will discuss why) are involved in the equation. In $2NaCl$ the 2 is the coefficient. The 2 tells us that there are two molecules of sodium present. In the equation $2NaCl$ there are a total of 2 sodium atoms and 2 chlorine atoms.

Balancing Chemical Equations

- How many oxygen atoms are present in $2Na_2O$? 3/1

- How many oxygen atoms are in each of the following:

Information: How To Balance Equations

Consider the reaction of sodium and chlorine to produce sodium chloride (table salt):

Remember that when chlorine is in Cl_2 it is always sodium as Cl_2 . On the product side of the equation there are only one chlorine atoms. So we need to put a 2 in front of the product side there is only one atom of sodium. Sodium atoms always disappear. In order to balance equation for table salt, we need to balance the equation. This can be done. But, by adding a 2 in the product side:
