voltage needed modes displays and alarms for each machine Case studies Real life clinical situations are presented including differential diagnosis and radiograph examples Helps readers to apply knowledge when presented with similar situations in their own NICU Global contributor base International editor and contributor team adds global perspective of neonatal respiratory medicine and expands potential market size

**A Study of Neonatal Volume-targeted Ventilation** Kevin Iain Wheeler, 2013 Background Preterm babies may need the help of a ventilator to breathe Although the assistance of a ventilator can be life saving ventilators may also injure the baby's immature lungs Traditionally pressure limited ventilation PLV techniques have been used which do not control the tidal volume VT entering the lungs New volume targeted ventilation VTV modes have been developed which aim to reduce lung injury by controlling the amount of air entering the lungs with each breath This thesis studied clinical and physiological aspects of neonatal volume targeted ventilation Aims 1 To perform an up to date systematic literature review examining the effect of VTV upon clinical outcomes 2 To examine the combined effects of VT and positive end expiratory pressure PEEP during aeration of the preterm lung 3 To report observations of Dr ger Babylog 8000 plus VTV in clinical practice during specific clinical situations obstructed flow and during surfactant administration 4 To examine the effects of specific ventilation back up rate circuit flow and maximum pressure Pmax setting during VTV with the Dr ger Babylog 8000 ventilator Methods These included systematic review meta analysis physiological and synchrotron based imaging in a preterm rabbit model and observational and interventional studies in humans Results 1 Compared with PLV VTV reduced the combined outcome of death or bronchopulmonary dysplasia pneumothorax days of ventilation hypocarbia and the combined outcome of periventricular leukomalacia or grade 3 4 intraventricular haemorrhage 2 During aeration of the preterm lung VT and PEEP had additive effects upon functional residual capacity FRC and lung compliance With PEEP 10 cm H<sub>2</sub>O using a higher VT increased the proportion of gas entering the lung bases improving homogeneity of ventilation However at lower PEEP increasing VT disproportionately increased the proportion of gas entering the apical basal regions 3 During clinical practice where VTV was provided using the Dr ger Babylog 8000 plus volume guarantee VG mode the ventilator responded to completely obstructed gas flow by reducing the peak inflating pressure PIP to half way between the maximum inflating pressure and the positive end expiratory pressure despite not achieving the set expired tidal volume This event was observed in most babies who received surfactant following which PIP increased for 30 60 minutes Target VT was less likely to be delivered if Pmax was set 10 cm H<sub>2</sub>O above the pre surfactant PIP 4 In stable ventilated babies reducing the back up ventilation rate from 50 to 30 inflations min increased the proportions of triggered inflations while maintaining patient stability and having a minimal effect on the overall ventilator rate Compared with using a circuit flow of 6 or 8 L min undesirable effects were observed with a circuit flow of 4 L min Setting the Pmax 5 cm H<sub>2</sub>O above the working PIP reduced the proportion of high volume inflations 10 mL kg compared with using Pmax 30 cm H<sub>2</sub>O for all babies and did not impact patient stability or the number of ventilator alarms Conclusions VTV strategies improve neonatal survival free of lung injury

The use of appropriate VT and PEEP during neonatal resuscitation may assist lung aeration however further studies are needed to assess lung injury In clinical practice the selection of appropriate ventilator parameters is important and affects how the baby and ventilator interact     **The BEAR 5 Ventilator Instructor Manual** Bear Medical Systems, Inc,1985
