ASSESSMENT OF POTENTIAL ERRORS IN MANUAL CALIBRATION OF A CONTINUOUS GLUCOSE MONITORING SYSTEM., 2017 Background Many continuous glucose monitoring CGM systems require manual calibration i.e input of blood glucose BG monitoring data at specific times in order to provide reliable CGM values Data from a CGM

performance assessment were used to investigate potential errors in manual calibration of a CGM system. Methods: Data were obtained from 20 subjects wearing a CGM system for 14 days. The study comprised in-clinic sessions and home use phases. Subjects were educated to the calibration process and during in-clinic sessions they were supervised by study staff. The following potential errors were assessed based on instructions for use: a) Calibration was not performed within the specified interval 12 hours \pm 5 hours tolerance; b) BG values were not used within 5 minutes of the BG measurement; c) BG measurement was entered incorrectly; d) glucose concentration was changing too rapidly estimated from CGM data. Results: See table. Conclusions: Manual calibration may be associated with errors. Even well-educated diabetes patients may perform 10% of calibrations or more incorrectly. Diabetes patients should take utmost care when manually calibrating CGM systems.
