

Control of Blood Sugar Levels

What hormones are involved in the homeostasis of blood sugar?

Why?

All living things use glucose as a source of energy. In vertebrates it is critical that the levels of glucose in the blood are consistent. Small fluctuations are fine, but if the glucose concentration in the blood gets too high, a coma could result. If the glucose concentration in the blood gets too low, the person could experience seizures, go into a coma or die. In humans, hormone levels help regulate the glucose concentration in the blood and keep us in homeostasis.

Model 1 – Hormonal Control of Glucose

1. The relative blood concentrations of which three molecules are recorded in the graph of Model 1?
Glucose, glucagon, and insulin.
2. Which molecule from Model 1 is found in the blood at the highest concentrations?
Glucose.
3. Why do cells need glucose?
Glucose is metabolized and provides the energy cells need to run cellular processes.
4. According to the graph in Model 1, what happens to blood glucose levels after a meal has been eaten?
Blood glucose levels increase.
