Post-transcriptional Control of Gene Expression Orna Resnekov, Alexander von Gabain, 2013-06-29 Many important cellular processes rely on posttranscriptional control of gene expression This book describes the mechanisms of gene expression at this level that occur in the cytoplasm of prokaryotes and eukaryotes Several introductory chapters discuss the general principles of translation and mRNA stability The interactions of mature mRNA with the translational machinery the components of mRNA degradation and antisense RNA are surveyed Subsequent chapters discuss protein folding transport modification and degradation The book is an invaluable source of information for both newcomers and those wishing an overview of the field

Exploring the Design Principles of Orthogonal Transcription Control Systems Shaunak Kar, 2021 The last two decades has witnessed an unprecedented growth in our ability to engineer biological systems for a wide range of applications ranging from the development of smart therapeutics production of valued products and chemicals and engineering crops with programmable traits and much more At the core of these capabilities has been the design and characterization of synthetic genetic programs that has enabled the predictable programming of cellular behavior and

phenotypes A fundamental challenge in the construction of such circuits and programs is being able to design and model them against a variety of organismal backgrounds which can be often difficult to predict and can lead to circuit failure when systems are ported across organisms Such failure modes can potentially be mitigated by embedding orthogonal modes of transcriptional control and regulation in genetic programs to drive the expression of the circuit components in both prokaryotes as well as eukaryotes Specifically in prokaryotes we demonstrate how an autoregulated network controlling the expression of an orthogonal RNA polymerase T7 RNA polymerase can be utilized to precisely express target genes in a highly predictable manner dictated by mutant T7 RNAP promoters Furthermore with the use of a modular architecture we show how such expression systems can be readily ported across diverse prokaryotes In each species the relative strength of expression obtained from the T7 RNAP homeostasis circuit is nearly identical suggesting T7 RNAP driven expression systems can be utilized as predictable cross species gene expression platform In another example orthogonal transcriptional regulation was engineered in a complex eukaryote plants using a programmable transcription factor dCas9 VP64 and a set of designed synthetic promoters whose activity can precisely regulated with the expression of specific guide RNAs gRNAs This strategy was used to construct three mutually orthogonal promoters allowing multiplexed control of gene expression in plants Overall the design strategies and architectures described in this work can be used to explore the design of more complex circuits where the activity of T7 RNAP can be coupled to regulate the activity of dCas9 based transcription to generate circuits operating across kingdoms of life

Transcription Regulation in Prokaryotes Rolf Wagner, 2000 I therefore regard this book as a standard extremely suitable not only for teaching to 3rd or 4th year undergraduate students with interest in cellular biology and molecular microbiology but also for senior scientists who have research interests in prokaryotic transcription regulation² Cell Biology International a superb compact yet comprehensive treatise on the regulation of gene expression principally but not exclusively in E Coli and its phage A must for all students at undergraduate or postgraduate level and also for reseachers of eukaryotic transcription who need reminding of a few paradigms AslibThis text is written for advanced students with a basic background in molecular biology and provides a clear and concise summary of the flow of information from genes to proteins in simple prokaryotic cells Transcription regulation is of central importance to molecular biology and in bacterial cells the major regulatory stage is transcription While most textbooks cover transcription in a single chapter with a strong emphasis on eukaryotic transcription this new text is devoted to prokaryotic transcription and is perfect for use on molecular biology microbiology and technology courses

Data-driven Inference of Dynamic Transcriptional Regulatory Mechanisms in Prokaryotes Aaron N. Brooks, 2014 Microbes tailor their physiology to diverse environments despite having streamlined genomes and few regulators Mechanisms by which microbes expand their genetic repertoire include modular reorganization of genetic expression through dynamic activity of complex gene regulatory networks GRNs Deciphering accurate GRNs is essential to understand how their topology contributes to cellular behavior

This dissertation develops computational methods to reverse engineer GRNs directly from genome sequence and transcriptome data. These data driven models capture dynamic interplay of environment and genome encoded regulatory programs for two phylogenetically distant prokaryotes: *E. coli*, a bacterium and *H. salinarum*, an archaeon. The models reveal how distribution of cis acting gene regulatory elements (GREs) and condition specific influence of transcription factors (TFs) at each element produces environment specific transcriptional responses. These regulatory programs partition and re organize transcriptional regulation of genes within regulons and operons into condition specific co regulated modules or corems. Corems capture fitness relevant co regulation by different transcriptional control mechanisms acting across the entire genome. Organization of genes in corems defines a system level principle for prokaryotic gene regulatory networks that extends existing paradigms of gene regulation and helps explain how microbes negotiate environmental change.

Plastid Proteostasis: Relevance of Transcription, Translation and Post-Translational Modifications Fiammetta Alagna, Michele Bellucci, Dario Leister, Andrea Pompa, 2017-12-28. Due to their bacterial endosymbiotic origin, plastids are organelles with both nuclear encoded and plastid encoded proteins. Therefore, a highly integrated modulation of gene expression between the nucleus and the plastome is needed in plant cell development. Plastids have retained for the most part a prokaryotic gene expression machinery but differently from prokaryotes and eukaryotes, they have largely abandoned transcriptional control and switched to predominantly translational control of their gene expression. Some transcriptional regulation is known to occur but the coordinate expression between the nucleus and the plastome takes place mainly through translational regulation. However, the regulatory mechanisms of plastid gene expression (PGE) are mediated by intricate plastid nuclear interactions and are still far from being fully understood. Although, for example, translational autoregulation mechanisms in algae have been described for subunits of heteromeric protein complexes and termed control by epistasy of synthesis (CES), only few autoregulatory proteins have been identified in plant plastids. It should be noted of course that PGE in *C. reinhardtii* is different from that in plants in many aspects. Another example of investigation in this research area is to understand the interactions that occur during RNA binding between nucleus encoded RNA binding proteins and the respective RNA sequences and how this influences the translation initiation process. In addition to this, the plastid retains a whole series of mechanisms for the preservation of its protein balance (proteostasis) including specific proteases as well as molecular chaperones and enzymes useful in protein folding. After synthesis, plastid proteins must rapidly fold into stable three dimensional structures and often undergo co and posttranslational modifications to perform their biological mission, avoiding aberrant folding, aggregation and targeting, with the help of molecular chaperones and proteases. We believe that this topic is highly interesting for many research areas because the regulation of PGE is not only of wide interest for plant biologists but has also biotechnological implications. Indeed, plastid transformation turns out to be a very promising tool for the production of recombinant proteins in plants, yet some limitations must still be overcome and we believe that this is mainly due to our

limited knowledge of the mechanisms in plastids influencing the maintenance of proteostasis

Regulation of Gene Expression

Gary H. Perdew, Jack P. Vanden Heuvel, Jeffrey M. Peters, 2014-11-22 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences. Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression. However, we have noticed a lack of books, especially textbooks, that provide an overview of the rationale and general experimental approaches used to examine chemically or disease-mediated alterations in gene expression in mammalian systems. For example, it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in transcription rates. *Regulation of Gene Expression: Molecular Mechanisms* is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel. Indeed, we are using this book to teach a graduate-level class at The Pennsylvania State University. For more details about this class, please visit <http://moltox.cas.psu.edu> and select Courses. The goal for our work is to provide an overview of the various methods and approaches to characterize possible mechanisms of gene regulation. Further, we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms that lead to altered activity of a specific protein within a cell.

Enhancers and Phase Separation in the Control of Gene Expression

John C. Manteiga, 2020 Gene regulation underlies the control of cell identity, development, and disease. Transcription of genes is regulated by DNA elements called enhancers, which are bound by transcription factors and coactivators, leading to the recruitment of RNA polymerase II and the production of RNA. Enhancers are thought to loop to specific gene promoters to stimulate transcription, but the mechanisms that cause enhancers to selectively loop to specific gene promoters is not well understood. In this thesis, I first describe new insights into enhancer-promoter loop specificity from studies examining the mechanisms that allow tumor-specific super enhancers to loop to the MYC oncogene in diverse cancer types (Schuijers and Manteiga et al 2018). While conducting these studies, it was proposed that super enhancers and the factors associated with them form liquid-liquid phase-separated condensates. Following this proposal, I contributed to collaborative studies that strongly supported this model (Boija et al 2018; Sabari et al 2018; see Appendix I and II of this thesis). This model of transcription led me to ask how key transcriptional components could be recruited into super enhancer condensates. I performed studies showing that the interaction of RNA polymerase II with these condensates involves the large heptapeptide repeat of the C-terminal domain (CTD) of the enzyme. Furthermore, these studies provided evidence that phosphorylation of the CTD, which is associated with the initiation-to-elongation transition, weakens these interactions, thus facilitating the transition of RNA polymerase II into different condensates involved in co-transcriptional splicing of the nascent transcript (Guo and Manteiga et al 2019). These studies provide new insights into the mechanisms of enhancer-promoter interaction, roles for the RNA polymerase II CTD in the enzyme's partitioning into nuclear

condensates and a role for phosphorylation in switching the nuclear condensate partitioning behavior of RNA polymerase II

Transcriptional Regulation in Eukaryotes Michael F. Carey, Stephen T. Smale, 2000 In the genome era the analysis of gene expression has become a critical requirement in many laboratories But there has been no comprehensive source of strategic conceptual and technical information to guide this often complex task Transcriptional Regulation in Eukaryotes answers that need Written by two experienced investigators Michael Carey and Stephen Smale at the UCLA School of Medicine and based in part on the Gene Expression course taught at Cold Spring Harbor Laboratory this book directly addresses all the concerns of a laboratory studying the regulation of a newly isolated gene and the biochemistry of a new transcription factor This important and unique book is essential reading for anyone pursuing the analysis of gene expression in model systems or disease states

Translational Regulation of Gene Expression 2 J. Ilan, 2012-10-24 This book which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in Translational Regulation of Gene Expression which was published in 1987 It is not a revision of the earlier book but rather an extension of that volume with special emphasis on mechanism As the reader will discover there is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein Thus we find that important proteins such as protooncogenes growth factors stress proteins cytokines lymphokines iron storage and iron uptake proteins and a panorama of prokaryotic proteins as well as eukaryotic viral proteins are translationally regulated Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription we can state that for these genes at least the expression is translationally controlled Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field The present book describes mechanisms of translational regulation in bacteria yeast and eukaryotic viruses as well as in eukaryotic genes In this book we try to provide in depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume

Plant Promoters and Transcription Factors Lutz Nover, 1994-03-07 The control of plant gene expression at the transcriptional level is the main subject of this volume Genetics molecular biology and gene technology have dramatically improved our knowledge of this event The functional analysis of promoters and transcription factors provides more and more insights into the molecular anatomy of initiation complexes assembled from RNA polymerase and the multiplicity of helper and control proteins Formation of specific DNA
