

The Differences Between

PREVENTIVE MAINTENANCE & PREDICTIVE MAINTENANCE

Preventive maintenance

- based on the expected or average life of the part
- carried out according to schedule
- a lot of redundant preventive servicing
- requires regular employee involvement
- low implementation cost, but high fixed costs
- generates a very high consumption of spare parts

Predictive maintenance

- is based on the actual consumption of machine parts
- is based on data provided by sensors
- servicing only when justified
- rare employee involvement
- high implementation cost but low fixed costs
- minimal consumption of spare parts

Condition-Based Maintenance and Residual Life Prediction Chandan Deep Singh, Davinder Singh, Kanwal Jit Singh, Harleen Kaur, 2025-03-10 Condition Based Maintenance and Residual Life Prediction is essential for those looking to effectively implement condition based maintenance strategies and enhance fault detection through a comprehensive understanding of vibration data analysis and residual life prediction addressing key challenges in the field. Issues related to condition based maintenance include its high initial cost, new techniques that can be difficult to implement due to resistance of older equipment that can be difficult to retrofit with sensors and monitoring equipment and difficult to access equipment during production that is difficult to spot measure. Keeping the above issues in mind, a general handbook for condition based maintenance and residual life prediction is required to carry out in fault detection. Condition Based Maintenance and Residual Life Prediction aims to develop, analyze and model condition based maintenance and residual life prediction through vibration data. The analysis of vibration responses will aid in developing a fault detection system. The sources of vibration may be due to the presence of different types of defects such as cracks in the shaft, a bent shaft or misalignment of shafts. This will give designers a diagnostic tool for predicting the trends of vibration conditions leading to early fault detection. The devised tool will be capable of quantifying the amplitude of vibration based on the severity of defects. With the features available in the devised diagnostic tool, the proposed model can be used for design, predictive maintenance and condition based maintenance.
