Digital Design and Computer Architecture David Harris, Sarah Harris, 2010-07-26 Digital Design and Computer

Architecture is designed for courses that combine digital logic design with computer organization architecture or that teach these subjects as a two course sequence Digital Design and Computer Architecture begins with a modern approach by rigorously covering the fundamentals of digital logic design and then introducing Hardware Description Languages HDLs Featuring examples of the two most widely used HDLs VHDL and Verilog the first half of the text prepares the reader for what follows in the second the design of a MIPS Processor By the end of Digital Design and Computer Architecture readers will be able to build their own microprocessor and will have a top to bottom understanding of how it works even if they have no formal background in design or architecture beyond an introductory class David Harris and Sarah Harris combine an engaging and humorous writing style with an updated and hands on approach to digital design Unique presentation of digital logic design from the perspective of computer architecture using a real instruction set MIPS Side by side examples of the two most prominent Hardware Design Languages VHDL and Verilog illustrate and compare the ways the each can be used in the design of digital systems Worked examples conclude each section to enhance the reader s understanding and retention of the material

Ultrasonic Distance Measurement Using Basys 3 FPGA Board Ramazan Kahraman,2019-10-22 System on a Chip SoC technology which has evolved in recent years is developed from different devices A processor several memory and peripheral components are located on a single chip to form today s high performance SoCs with hundreds of IP blocks IP cores are validated design blocks used as part of complex digital designs Those designs are utilizing a hardware description language like VHDL or Verilog In this way time and cost of launching the product are reduced Thanks to SoC the features of computers were able to be reduced to the miniature level Microcontrollers have the features of computer systems on a single chip They are used to collect process and manipulate data in complex projects The complexity of microcontrollers has increased to provide better performance and flexibility to meet customer requirements However it must be able to adapt to operational changes The hardware of a microcontroller can not be changed afterward If subsequent changes are nevertheless necessary these are associated with high additional costs Reconfigurable devices such as FPGAs can reconfigure the hardware to design develop and deploy high performance digital systems With the power of a SoC combined with the flexibility of an FPGA the MC8051 IP Core proves to be a great alternative to purely microcontroller based systems
