Chapter 3, Lesson 1

What is Density?

DEMONSTRATION

1. Look at the drawing of the copper and aluminum cubes and their atoms.

Copper and aluminum atoms are arranged the same way, but copper atoms are slightly larger than aluminum atoms. Therefore, there are fewer copper atoms in the copper cube than aluminum atoms in the aluminum cube.

If there are fewer copper atoms in the cube, why does the copper cube weigh more than the aluminum cube?

The copper atoms are so much heavier than the aluminum atoms that even though there are fewer copper atoms, their greater mass makes the copper cube heavier.

2. The density of a substance like copper or aluminum is its mass divided by its volume (how much space it takes up).

Density = mass/volume or $D = m/v$.

Which is more dense, copper or aluminum? How do you know?

Copper is more dense than aluminum. The copper must be more dense because when you compare equal volumes of the two substances, the copper has greater mass.

3. How do you find the volume of a cube?

To find the volume of a cube, you would measure the length x width x height. Since each side of a cube has the same measurement, you could measure just one side in

centimeters and then cube that measurement to get the volume in cm^3 .

- a. How do you find the mass of a cube?

To find the mass of the cube, you put it on a balance and measure the mass in grams.

- a. How do you know the volume and mass of a cube. How do you find the density of the cube?

Density = mass/volume. To find the density of the cube, you divide the mass by the volume and get the result in g/cm^3 .

- a. Calculate the density of a cube using the following information:

- i. Each side is 3 cm long.

- i. The mass of the cube is 108g.

Volume = $3 \times 3 \times 3 = 27 \text{ cm}^3$ Mass = 108 grams

Density = mass/volume = $108 \text{ grams} / 27 \text{ cm}^3 = 4 \text{ g/cm}^3$
