

Vector Kinematics Practice Test

1. Vectors **P** and **Q** in the grid below represent velocities. Each side of each little square in the grid represents a speed of 1m/s.

Let vectors **P** and **Q** represent the initial and final velocities respectively of a particle over a 4.0s time interval. Find the magnitude of the average acceleration during this time interval. The spare bit of grid is there for your convenience.

$$\theta = \tan^{-1}\left(\frac{3}{12}\right) = 30.3^\circ$$

$$\text{LOL: } R = 15 \text{ m/s}$$

$$a = \frac{\Delta v}{t} = \frac{v_f - v_i}{t} = \frac{15}{4} = 3.75 \text{ m/s}^2$$

2. The vector v_1 in the diagram below is equivalent to:

- a. $v_1 + v_2 = v_2$ b. $v_1 + v_2 = v_1$ c. $v_1 - v_2 = v_2$ d. $v_2 + v_2 = v_2$

3. A vehicle traveling north at 9.0m/s changes its velocity to 12m/s west. Which one of the following best represents its **change** in velocity?

b.

c.

d.

$$\Delta v = v_f - v_i = 12\text{W} - 9\text{N} = 12\text{W} + 9\text{S}$$

Engineering Dynamics 2.0 Lester W. Schmerr, 2019-01-10 This book presents a new approach to learning the dynamics of particles and rigid bodies at an intermediate to advanced level There are three distinguishing features of this approach First the primary emphasis is to obtain the equations of motion of dynamical systems and to solve them numerically As a consequence most of the analytical exercises and homework found in traditional dynamics texts written at this level are replaced by MATLAB based simulations Second extensive use is made of matrices Matrices are essential to define the important role that constraints have on the behavior of dynamical systems Matrices are also key elements in many of the software tools that engineers use to solve more complex and practical dynamics problems such as in the multi body codes used for analyzing mechanical aerospace and biomechanics systems The third and feature is the use of a combination of Newton Euler and Lagrangian analytical mechanics treatments for solving dynamics problems Rather than discussing these two treatments separately Engineering Dynamics 2 0 uses a geometrical approach that ties these two treatments together leading to a more transparent description of difficult concepts such as virtual displacements Some important highlights of the book include Extensive discussion of the role of constraints in formulating and solving dynamics problems Implementation of a highly unified approach to dynamics in a simple context suitable for a second level course Descriptions of non linear phenomena such as parametric resonances and chaotic behavior A treatment of both dynamic and static stability Overviews of the numerical methods ordinary differential equation solvers Newton Raphson method needed to solve dynamics problems An introduction to the dynamics of deformable bodies and the use of finite difference and finite element methods Engineering Dynamics 2 0 provides a unique modern treatment of dynamics problems that is directly useful in advanced engineering applications It is a valuable resource for undergraduate and graduate students and for practicing engineers
