techniques taking the construction of a process model for granted Process Modelling for Control concentrates on the  
modelling steps underlying a successful design answering questions like How should I carry out the identification of my  
process in order to obtain a good model How can I assess the quality of a model with a view to using it in control design How  
can I ensure that a controller will stabilise a real process and achieve a pre specified level of performance before  
implementation What is the most efficient method of order reduction to facilitate the implementation of high order  
controllers Different tools namely system identification model controller validation and order reduction are studied in a  
framework with a common basis closed loop identification with a controller that is close to optimal will deliver models with  
bias and variance errors ideally tuned for control design As a result rules are derived applying to all the methods that provide  
the practitioner with a clear way forward despite the apparently unconnected nature of the modelling tools Detailed worked  
examples representative of various industrial applications are given control of a mechanically flexible structure a chemical  
process and a nuclear power plant Process Modelling for Control uses mathematics of an intermediate level convenient to  
researchers with an interest in real applications and to practising control engineers interested in control theory It will enable  
working control engineers to improve their methods and will provide academics and graduate students with an all round view  
of recent results in modelling for control Advances in Industrial Control aims to report and encourage the transfer of  
technology in control engineering The rapid development of control technology has an impact on all areas of the control
