Oxygen enters the mouth/nose, then travels through the pharynx and trachea (windpipe), to the lungs (via the two bronchial tubes), to the alveoli (air sacs), to the capillaries (where the oxygen is exchanged for carbon dioxide on a red blood cell). The Oxygen goes on to fortify a body cell, while the red blood cell takes the  $\text{CO}_2$ , which is then breathed out at the end of the cycle. The diaphragm contracts (tightens) and moves down when we breathe in then relaxes and moves up when we breathe out.
