Automata theory has come into prominence in recent years with a plethora of applications in fields ranging from verification to XML processing and file compression. In fact the 2007 Turing Award was awarded to Clarke Emerson and Sifakis for their pioneering work on model checking techniques. To the best of our knowledge there is no single book that covers the vast range of applications of automata theory targeted at a mature student audience. This book is intended to fill that gap and can be used as an intermediate level textbook. It begins with a detailed treatment of foundational material not normally covered in a beginner's course in automata theory and then rapidly moves on to applications. The book is largely devoted to verification and model checking and contains material that is at the cutting edge of verification technology. It will be an invaluable reference for software practitioners working in this area. *Automata, Languages and Programming* Thomas Ottmann, 2014-01-15

**Automata Theory and its Applications** Bakhadyr Khoussainov, Anil Nerode, 2012-12-06 The theory of finite automata on finite strings, infinite strings and trees has had a distinguished history. First automata were introduced to represent idealized switching circuits augmented by unit delays. This was the period of Shannon, McCulloch and Pitts and Howard Aiken ending about 1950. Then in the 1950s there was the work of Kleene on representable events of Myhill and Nerode on finite coset congruence relations on strings, of Rabin and Scott on power set automata. In the 1960s there was the work of Büchi on automata on infinite strings and the second order theory of one successor, then Rabin's 1968 result on automata on infinite trees and the second order theory of two successors. The latter was a mystery until the introduction of forgetful determinacy games by Gurevich and Harrington in 1982. Each of these developments has successful and prospective applications in computer science. They should all be part of every computer scientist's toolbox. Suppose that we take a computer scientist's point of view. One can think of finite automata as the mathematical representation of programs that run using fixed finite resources. Then Büchi's SIS can be thought of as a theory of programs which run forever like operating systems or banking systems and are deterministic. Finally Rabin's S2S is a theory of programs which run forever and are nondeterministic. Indeed many questions of verification can be decided in the decidable theories of these automata.
