

A close-up photograph of the internal gears of an automatic transmission. The gears are made of metal and are coated with a layer of oil. The image is slightly blurred, emphasizing the mechanical components. A yellow rectangular box with a blue border is overlaid on the bottom right of the image, containing the title text.

Automatic Transmission First Gear Clunks:

Minimizing of Automotive Transmission Rattle Noise by Means of Gear Oils Axel Baumann, 2022-07-20 Caused by downsizing of combustion engines the torque fluctuation at the crankshaft induces torsional vibrations in the powertrain Manual transmissions and dual clutch transmissions are particularly sensitive to gear rattle noise Gear rattle noise arises from oscillations of loose parts with clearance e g idler gears synchronizer rings and gearshift sleeves The aim of this research is the formulation of a gear oil for the application in a manual transmission to minimize gear rattling noise Acoustic measurements on a gear rattle noise test bench verify the noise reduction of the developed gear oils with commonly used low oil viscosity An analysis of the transmission error proves that gear tooth impacts during rattling lead to elastic deformation of the meshing gear pairs The main source for the intensity of gear rattle noise is the additional presence of meshing impacts at the beginning of each gear pair meshing Gear rattle noise reduction can be achieved by avoiding meshing impacts e g by minimizing the traction coefficient of the gear oil
