

Chapter 1 Online UPS Theory and Description

1.1 Introduction

Uninterruptible Power Supplies (UPS) are electronic devices designed to provide power to critical mission systems. An Online UPS (OUPS) provides continuous power to the load during power outage or glitches caused by power source switching.

1.1.1 The Concept of an Online UPS

The minimum components needed to design an Online UPS are the rectifier, the battery bank and the inverter. The rectifier converts the distribution line's AC (Alternating Current) power to DC

(Direct Current), the form of current suitable to store energy in a battery bank. At all times, this

DC is also fed to an inverter, which reconverts the DC power to an AC waveform connected to

any equipment utilizing AC that a user considers as mission critical. If the AC supply fails for

any reason, the inverter will continue to draw power from the batteries.

Figure 1-1. A Basic Online UPS

1.1.2 Input Power Factor Control (PFC)

When a sinusoidal input signal is connected to a full wave rectifier, conduction will occur only

during the peaks of the signal. This causes a two-fold inconvenience to the electricity distribution

line:

- Insertion of harmonics to the lines
- High current peaks, which imply greater losses on the distribution
