

Blood Glucose Metabolism

Model 1: The Oral Glucose Tolerance Test (OGTT)

The Oral Glucose Tolerance Test is often used to detect diabetes mellitus. The following procedure is used to conduct an OGTT:

1. The test is conducted to test a test subject during the day, fasting, up to three times.
2. Fasting is measured as the time going in (absorbing) the 75 g of D-glucose prior to the test (usually overnight).
3. An identical test patient is then prepared (glucose collection, the subject) and measurements of the subject are taken according to the patient's body weight(s).
4. Measurements of the patient's blood glucose levels are taken every 30 minutes as they begin the 2-hour (or additional) or about 2.5-minute (longer) the administration of the OGTT. In general, each morning, morning, the blood glucose are taken at these times and at their levels. In general, during the OGTT, glucose levels are recorded every 30 minutes and for longer durations, if a test.

The following data table shows acceptable maximum measurements taken for the OGTT:

Time (minutes)	0	30	60	90	120
Maximum Blood Glucose (mg/dL)	100	175	140	130	100
Maximum Blood Glucose (mg/dL)	90	170	130	110	80

QUESTIONS

1. What do people measure in the test of the Oral Glucose Tolerance Test? How is the subject and measurement data used?
2. glucose infusion + metabolic and endocrine (glycemia, insulin, weight)
