

Cellular Respiration—An Overview

What are the phases of cellular respiration?

Why?

All cells need energy all the time, and their primary source of energy is ATP. The methods cells use to make ATP vary depending on the availability of oxygen and their biological make-up. In many cases the cells are in an oxygen-rich environment. For example, as you sit and read this sentence, you are breathing in oxygen, which is then carried throughout your body by red blood cells. But, some cells grow in environments without oxygen (yeast in wine-making or the bacteria that cause botulism in canned food), and occasionally animal cells must function without sufficient oxygen (as in running sprints). In this activity you will begin to look at the aerobic and anaerobic processes that are used by all organisms to produce ATP.

Cellular Respiration A. Malcolm Campbell, Christopher J. Paradise, 2016-03-28 What happens to a meal after it is eaten Food consists primarily of lipids proteins and carbohydrates sugars How do cells in the body process food once it is eaten and turned it into a form of energy that other cells can use This book examines some of the classic experimental data that revealed how cells break down food to extract the energy Metabolism of food is regulated so that energy extraction increases when needed and slows down when not needed This type of self regulation is all part of the complex web of enzymes that convert food into energy Adding to this complexity is that all food eventually winds up as two carbon bits that are all processed the same way This book will also reveal why animals breathe oxygen and how that relates to the end of the energy extraction process and oxygen's only role in the body Rather than look at all the details this book takes a wider view and shows how cellular respiration is self regulating

Cellular Respiration The Open The Open Courses Library, 2019-11-07 Cellular Respiration Biology An electrical energy plant converts energy from one form to another form that can be more easily used This type of generating plant starts with underground thermal energy heat and transforms it into electrical energy that will be transported to homes and factories Like a generating plant plants and animals also must take in energy from the environment and convert it into a form that their cells can use Mass and its stored energy enter an organism's body in one form and are converted into another form that can fuel the organism's life functions In the process of photosynthesis plants and other photosynthetic producers take in energy in the form of light solar energy and convert it into chemical energy in the form of glucose which stores this energy in its chemical bonds Then a series of metabolic pathways collectively called cellular respiration extracts the energy from the bonds in glucose and converts it into a form that all living things can use Chapter Outline Energy in Living Systems Glycolysis Oxidation of Pyruvate and the Citric Acid Cycle Oxidative Phosphorylation Metabolism without Oxygen Connections of Carbohydrate Protein and Lipid Metabolic Pathways Regulation of Cellular Respiration The Open Courses Library introduces you to the best Open Source Courses *Chapter Resource 5 Photosynthesis/Cell Response Biology* Holt Rinehart & Winston, Holt, Rinehart and Winston Staff, 2004
