## How Do Plants Use the Energy from the Sun?

Plants make \_\_\_\_\_ by using energy from \_\_\_\_\_. The plant transforms \_\_\_\_\_ ( $\text{CO}_2$ ) from the air and water ( $\text{H}_2\text{O}$ ) taken from the ground by roots into \_\_\_\_\_ ( $\text{C}_6\text{H}_{12}\text{O}_6$ ) and \_\_\_\_\_ ( $\text{O}_2$ ). This unique process is called *photosynthesis*. The process itself occurs in the \_\_\_\_\_ of the plant cell. Plants can take in  $\text{CO}_2$  through tiny openings called *stomata* on their leaves. Guard cells on the leaves open and close the stomata.

Cellular \_\_\_\_\_ is when a plant and animal cell breaks down simple sugars into  $\text{CO}_2$  and water. This process releases energy in the form of adenosine triphosphate (ATP). The \_\_\_\_\_ is used for all processes within a cell that need \_\_\_\_\_. Think of it as an energy bar for the cell. The process of cellular respiration occurs in the \_\_\_\_\_.

In science, a chemical reaction is a process in which one or more substances, the *reactants*, are converted to one or more different substances, which are *converted* into products. Think of reactants as the ingredients in a recipe, and the product is the meal. Reactions are substances that start the chemical reaction. A product is a substance, but one that is produced at the end of the reaction. The \_\_\_\_\_ between reactants and products in a chemical reaction can be written as follows:

## Reactants → Products

The arrow ( $\rightarrow$ ) represents the direction in which the reaction occurs. Please note that sometimes, the reaction can occur in the opposite direction.

**Cellular Respiration** A. Malcolm Campbell, Christopher J. Paradise, 2016-03-28 What happens to a meal after it is eaten Food consists primarily of lipids proteins and carbohydrates sugars How do cells in the body process food once it is eaten and turned it into a form of energy that other cells can use This book examines some of the classic experimental data that revealed how cells break down food to extract the energy Metabolism of food is regulated so that energy extraction increases when needed and slows down when not needed This type of self regulation is all part of the complex web of enzymes that convert food into energy Adding to this complexity is that all food eventually winds up as two carbon bits that are all processed the same way This book will also reveal why animals breathe oxygen and how that relates to the end of the energy extraction process and oxygen's only role in the body Rather than look at all the details this book takes a wider view and shows how cellular respiration is self regulating
