

Science 9 - Unit D Review Sheet

Learning Outcomes

Can you?

- o distinguish between static and current electricity and identify evidence of each
- o assess the potential danger of an electrical device by checking its voltage and amperage
- o distinguish between safe and unsafe activities when dealing with electricity
- o identify electrical conductors and insulators
- o evaluate the use of different chemicals, chemical concentrations, and designs for electrical storage cells
- o identify electrical conductors and resistors
- o compare the resistance of different materials
- o use switches and resistors to control current
- o predict the effects of switches, resistors, and other devices
- o use models to describe and relate electrical current, resistance, and voltage
- o measure voltages and amperages in circuits
- o calculate resistance using Ohm's law
- o develop, test, and troubleshoot circuit designs
- o draw circuit diagrams for toys, models, and household appliances
- o compare and contrast microelectronic circuits and circuits in a house
- o identify, describe, and interpret examples of mechanical, chemical, thermal, and electrical energy
- o describe evidence of energy transfer and transformation
- o identify forms of energy inputs and outputs
- o apply appropriate units, measures, and devices in determining and describing quantities of electrical energy
- o construct, use, and evaluate devices for transforming mechanical energy to electrical energy and electrical energy to mechanical energy
- o evaluate modifications to electrical devices
- o apply the concepts of conservation of energy and efficiency to the analysis of energy devices
- o compare energy inputs and outputs of a device, and calculate its efficiency
- o describe techniques for reducing energy waste in common household devices

Unit at a Glance

- Excess electrons on an object create a negative charge. A shortage of electrons creates a positive charge.
- The Laws of Charge state that:
 - o unlike charges attract
 - o like charges repel
 - o charged objects attract uncharged (neutral) objects
- Conductors allow electric charge to move freely. Insulators prevent charge from moving freely.
- The basic parts of all electric circuits are a source of electric energy, conductors, a load, and a control device.
- Quantity of charge is measured in coulombs.
- Current is measured in amperes.
- Voltage (potential difference) is a measure of the energy of a standard unit of charge, and is measured in volts.
- Resistance is the property of substances that hinders charge motion and converts electric energy into heat. Resistance is defined as the ratio of voltage to current (Ohm's Law).
- A series circuit has one current path. A parallel circuit has more than one path along which current can flow.
- Thermocouples convert thermal energy to electric energy.
- Piezoelectric materials generate a small voltage when the pressure on them changes.
- Photovoltaic (solar) cells convert light energy to electric energy.
- Alessandro Volta observed that two different metals in a solution could generate a voltage. These observations led to the development of electrochemical cells and batteries, which consist of several cells connected together.
- Electric generators convert mechanical energy to electric energy. Their operation is based on the relationship between magnetism and electricity.
- Direct current (DC) flows in only one direction. Alternating current (AC) reverses direction periodically.
- The power grid generates and distributes AC electricity using transformers to change voltage
- for efficient power transmission.
- In homes, electric current travels through an electric meter and a service panel to branch circuits. Circuit breakers or fuses in the service panel cut off excessive current before wiring can overheat.
- Electric power is the product of voltage and current. Power measures the quantity of energy transfer each second.
- All electronic devices convert some input energy into waste heat, so they are not perfectly efficient.
