Introduction to the Basic Concepts of Modern Physics Carlo Maria Becchi, Massimo D'Elia, 2015-08-28 This is the third

edition of a well received textbook on modern physics theory This book provides an elementary but rigorous and self contained presentation of the simplest theoretical framework that will meet the needs of undergraduate students In addition a number of examples of relevant applications and an appropriate list of solved problems are provided Apart from a substantial extension of the proposed problems the new edition provides more detailed discussion on Lorentz transformations and their group properties a deeper treatment of quantum mechanics in a central potential and a closer comparison of statistical mechanics in classical and in quantum physics The first part of the book is devoted to special relativity with a particular focus on space time relativity and relativistic kinematics The second part deals with Schrödinger's formulation of quantum mechanics The presentation concerns mainly one dimensional problems but some three dimensional examples are discussed in detail The third part addresses the application of Gibbs statistical methods to quantum systems and in particular to Bose and Fermi gases
