

5TH GRADE SCIENCE

Solar Systems Objects

SC.5.E.5.3
Solar System Objects

Solar System Objects

Comets
A comet is a chunk of frozen gases, rock, ice, and dust. Comets have long orbits around the sun. Some comets come close to the sun, begin to break apart, and release a long tail of gas and dust. These particles reflect light and are visible as long tails. A comet's tail always points away from the sun.

The Flying Objects
Besides planets, there are many other bodies that orbit the sun. Let's find out about some of them.

Moons
Other moons are very different from Earth's moon. Europa, one of Jupiter's moons, may have a liquid ocean under a layer of ice. Another of Jupiter's moons, Io [YO-uh], has the most active volcanoes of any body in the solar system.

Dwarf Planets
Pluto was once called a planet. But in 2006, it was reclassified as a dwarf planet. Dwarf planets are nearly round bodies whose orbits cross the orbits of other bodies. Most are found in a region of the solar system beyond Neptune's orbit called the Kuiper belt. These objects are far away and hard to study. Quaoar, whose name was discovered in 2002.

Asteroids
Asteroids are rock and iron objects that orbit the sun. Millions of them are found in the wide region between Mars and Jupiter. Asteroids are made of rock and metal.

Meteoroids
Each day, tons of meteoroids enter Earth's atmosphere. Meteoroids are pieces of rock that are too small to be planets. They travel through space. Most meteoroids burn up in Earth's atmosphere, causing a streak of light called a meteor. Meteoroids that reach Earth's surface are called meteorites.
