Adapt to Changing Environment** Qing Wang, Dongdong Shao, Yu Zhang, Qin Zhu, 2025-06-05 Coastal wetlands provide  
precious ecological services for us like coastal protection carbon storage flooding mitigation production and so on Mangrove  
saltmarsh sea grass oyster reef and coral reef are typical types of coastal wetland each type has its unique adaptive strategy  
to climate change through some processes and mechanisms Some of them are well known to us but most are unrecognized as  
they are far away from our living environment Furthermore in the context of climate change and anthropogenic influence the  
external disturbance is more complicated and changeable causing the responses of species and the related processes more  
secluded and unpredictable Therefore the multilevel processes or mechanisms in coastal wetland to adapt to climate change  
as well as the solutions is urgent and important to face the new challenges Coastal wetlands lie in the transition zone  
between lands and seas defending us from storms and floodings and providing important and valuable ecosystem services  
such as carbon stock and biodiversity maintenance However coastal wetlands are vulnerable and are one of the most  
physically disturbed ecosystems on earth because they are always in hydrodynamic conditions under the interactions among  
tides waves runoffs and so on Furthermore the combined impacts of climate change and human activities have caused more  
uncertainties and complexities on the environmental factors which imposed unparalleled impacts on the diversity distribution  
and ecological performance of coastal wetland ecosystem globally      Study Guide for the Core Curriculum for Oncology
