UKF Replacement of Trading Floor Network (Network Design, Layer 1, 2 and 3)

### **Introduction**

UKF network design for layer 1 to layer 3 (LAN), is built on a series of hardware and protocols that are going to be operating interactively with each other. Building the network in layers enables the easy making of changes in the network as it grows. Changing a small portion of the network infrastructure requires a hierarchical design that allows and strengthening of the system. The three network layers include core layers, distribution layer, and access layer. The core purpose of each layer is to ensure that packets are quickly moved in a fast and easy way as possible. The movement enables natural filtering of the packets while using some access list, routers in the access. Given the distribution layer is situated between the core of the access layer, it acts as a demarcation point. The distribution provides a boundary definition where the two layers of networks are creatively combined. The filtering of routes through the core layers enables the easy handling of the packet in a way that it can be easily shared. Other important factors include switching, security, IPv6 configuration and subnetting, and protocol development. Essentially, the stability and security network forms the background of this research.

## **Project Assumptions**

There are assumptions involved in developing the system. Jin et al., (2004, p. 32) argue that assumptions help to categorize the network. Assumptions are projected into three main groups, network routing, network latency and IDMaps infrastructure. The latency between the source and destination of a network remains on smaller latency that is reflected on the segments of the path between the source and the destination. The assumption is not on realistic since they create routes through the changes experienced from time to time. Routing and switching will be considered optimal if packets from the source destination follow the shortest path possible. Hence, the ITT assumes that configuration will be selecting the right route to minimize the possible hop count. The network service providers generalize and optimize network latencies for the performance reasons. Besides, the assumption of efficient routing makes the need for trace placement easier since they are additive and hold triangulation.

## **Total Cost of Ownership (TCO)**

It is important to embed the management functionality as operating inside the network, which implies the required functionality of the provided centrally of the network. The team will be consulting the management on the possibility of providing the overall network. FitzGerald and Dennis (2009, p. 575) claim that the contribution of the network management provides a deeper analysis of the total cost of the ownership. This encourages the management to understand the system results in a reduction of the overall costs means, which means that it is possible to reflect on
