

Cloud Computing- Research Issues and Challenges

Nazia Majadi

Cloud computing uses the internet and central remote servers to maintain data and applications. It allows consumers and businesses to use applications without installation and access their personal files at any computer with internet access. This technology allows for much more efficient computing by centralizing data storage, processing and bandwidth. The appearance of cloud computing has made a tremendous impact on the Information Technology (IT) industry over the past few years. Recently IT industry needs Cloud computing services to provide best opportunities to real world. Cloud computing is in initial stages, with many issues still to be addressed. The objective of this paper is to explore the different research issues and challenges of cloud computing and identify important research opportunities in this increasingly important area. In this paper, there are different challenges categorized under design, performance, and security challenges.

Field of Research: Information Technology (IT)

I. Introduction

According to the National Institute of Standards and Technology (NIST) definition [1] Cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction. The name comes from the use of a cloud-shaped symbol [2] as an abstraction for the complex infrastructure it contains in system diagrams (see Fig. 1). Cloud computing entrusts remote services with a user's data, software and computation.

Cloud computing [3] recently received considerable attention, as a promising approach for delivering Information and Communication Technologies (ICT) services. With the fast development of processing, storage technologies, the sensation of the Internet, and computing resources have become cheaper, more powerful and more universally available than ever before. This technological trend has enabled the realization of a new computing model called cloud computing. The traditional cloud computing service provider is divided as the infrastructure providers who supervise cloud platforms and lease resources according to a pay-per-use based model, and service providers, who rent resources from more infrastructure providers to serve the end users. From the past few years, the cloud computing has made a tremendous impact on the Information Technology (IT) industry, where large companies such as Google, IBM, Amazon and Microsoft struggle to provide more powerful, reliable and cost-efficient cloud platforms, and business enterprises seek to find new paradigm in their business models.
