Electromagnetic Induction: Conceptual and Experiment for Secondary-School Level

# Faraday's Electromagnetic Lab

## Purpose:

To demonstrate induced currents – currents caused by a changing magnetic field – experimentally.

## Equipment required:

1. Faraday's Electromagnetic Lab (available at <http://phet.colorado.edu/en/sim>)

## Introduction:

When a wire circuit is placed in a magnetic field and the field is changed, an electric current is induced in the circuit. This is called electromagnetic induction. The induced current produces its own magnetic field, which opposes the change in the original magnetic field. This is called Lenz's law.

The application of electromagnetic induction is the basis of many modern technologies. For example, a generator is a device that converts mechanical energy into electrical energy. It does so by rotating a coil of wire in a magnetic field, which induces a current in the coil.

The induced current can be used to power a circuit. For example, a small motor can be made by placing a coil of wire in a magnetic field and passing a current through it. The current will induce a magnetic field that opposes the original field, causing the coil to rotate.

## Procedure:

### Step 1: Introduction

Step 1: Run the first sim, Faraday's Electromagnetic Lab. It should appear like the image below. Explore the various tabs displayed at the top. A yellow rectangle is highlighted.

Step 2: Select the Induction tab. In the center, there is a bar magnet. Move the magnet in and out of the coil. Notice the light bulb. When the magnet is moved in and out of the coil, the light bulb will glow. This is the induced current.

Step 3: In the top right corner, there is a graph. The graph shows the induced current. When the magnet is moved in and out of the coil, the graph will show a positive or negative peak. This is the induced current.
