Weeks,Tanvi Bafna ,Mohua Chakraborty Choudhury,2025-10-09 Healthcare workers burnout is a global issue COVID 19 pandemic had a significantly negative effect on the morale and resilience of healthcare workers High rates of depression anxiety and PTSD have been well documented across the globe for healthcare workers contributing to high turnover and attrition rates Occupational burnout not only affects the healthcare workers but is also detrimental to patient safety and organizational productivity Burnout should be seen as a continuum ranging from job dissatisfaction to psychiatric morbidity It is important to educate health professionals and employ primary and secondary preventative strategies at every stage of burnout for the optimal functioning of healthcare systems Although numerous observational studies highlight high rates of burnout among healthcare workers there has been little research to demonstrate effectiveness of interventions to support mental well being of healthcare workers during stressful times Investigation of potential resilience building interventions is especially important to prepare for the next pandemic or large scale disaster In addition robust evidence based guidelines and best practices are needed to reduce the high rates of burnout and promote wellbeing in healthcare workforce by integrating and addressing the full spectrum of occupational organizational social personal and psychological factors There are significant gaps in the existing literature including lack of prospective longitudinal intervention studies research focusing the needs of minority healthcare workers and identifying barriers to promote institutional wellbeing culture **The United States Catalog** ,1924 **Energy Research Abstracts** ,1985
