**Current:** it refers to flow anything, for example water current- flow of water.

### Electric current

Electric current is defined as the rate of flow of electric charges through any cross-section of the conductor.

$$I = \frac{\Delta Q}{\Delta t}$$

**Instantaneous current:** current through the given conductor at given instant of time.

$$I = \lim_{\Delta t \rightarrow 0} \frac{\Delta Q}{\Delta t} = \frac{dq}{dt}$$

It is a Scalar quantity

**SI Unit:** ampere (A)

### One ampere or unit current:

Electric current through a conductor is said to be one ampere if one coulomb of charge flows through any cross-section of the conductor per unit time.

$$1A = \frac{1C}{1s}$$

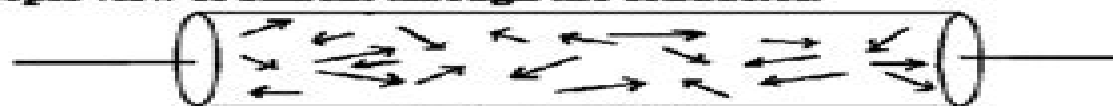

**Conventional current:** The direction of flow of positive charge gives the direction of electric current. This current is known as conventional current.

**Or**

It is in the direction of electric field in the conductor.

Random motion of free electron does not constitute to electric current through the conductor.

### Microscopic view of current through the conductor:

$E=0$  and at  $T>0K$

In a solid conductor, atoms/molecules are closely packed and the valence electrons of an atom are not attached firmly to its nucleus. These valence electrons are free to move throughout the volume of the solid and hence known as free or conduction electrons.
