

# Blackberry control practices

## Summary

- The control of blackberry is a long-term process and cannot be achieved with one-off effort. This is particularly the case for larger infestations.
- There is a range of management options available for controlling blackberry, including physical methods, biological control and herbicides.
- Herbicides are highly effective tools for controlling blackberry, and their use is the most reliable method for achieving local eradication. Only herbicides registered for the control of blackberry or authorised under a permit should be used.
- The level of control with herbicides is variable and is influenced by a range of factors.
- The most appropriate technique for applying herbicides will vary among sites and depends on a range of factors. Techniques for application include foliar, cut stump, granules or gel, and aerial applications.
- Legislation in Australia generally requires a minimum level of accredited training for operators applying herbicides. The minimum industry standard level of training across Australia is Australian Qualification Framework (AQF) Level 3.
- Using physical control methods alone often leads to poor results. Combining a range of physical control methods with the strategic use of herbicides is a more reliable approach.
- There is currently only one biological control agent approved and released in Australia. The leaf rust fungus (*Phragmidium violaceum*) attacks only European blackberry. It is efficient at spreading by natural means where environmental conditions are suitable.
- There are also a number of natural enemies of blackberry in Australia, including the leaf-eating mite (*Acanthus essigi*), which attacks blackberry species, including those resistant to the rust fungus.
- Site rehabilitation is an important control tool. Revegetation with appropriate plants prevents or minimises reinvasion with blackberry and other weed species.
- Generally no single control option used in isolation will succeed. A control program should be well planned to consider all the management options available and to ensure they are appropriately integrated for maximum control. See Part 5 (p. 21) for an example of an integrated program.

**Biological Control of Weeds in Australia** M. H. Julien, R. E. McFadyen, Jim Cullen, 2012 Biological control of weeds has been practiced for over 100 years and Australia has been a leader in this weed management technique The classical example of control of prickly pears in Australia by the cactus moth *Cactoblastis cactorum* which was imported from the Americas helped to set the future for biocontrol of weeds in many countries Since then there have been many projects using Classical Biological Control to manage numerous weed species many of which have been successful Importantly there have been no serious negative non target impacts the technique when practiced as it is in Australia is safe and environmentally friendly Economic assessments have shown that biocontrol of weeds in Australia has provided exceedingly high benefit to cost ratios This book reviews biological control of weeds in Australia to 2011 covering over 90 weed species and a multitude of biological control agents and potential agents Each chapter has been written by practicing biological control of weeds researchers and provides details of the weed the history of its biological control exploration for agents potential agents studied and agents released and the outcomes of those releases Many weeds were successfully controlled some were not many projects are still underway some have just begun however all are reported in detail in this book Biological Control of Weeds in Australia will provide invaluable information for biological control researchers in Australia and elsewhere Agents used in Australia could be of immense value to other countries that suffer from the same weeds as Australia The studies reported here provide direction to future research and provide examples and knowledge for researchers and students **KEY FEATURES** A unique collation of information for Australian weed research and management Contains all the information about biological control of weeds in Australia in one book Provides key references for further information Will become a well cited publication

**Wetland Weeds** Nick Romanowski, 2011-09-05 This comprehensive guide to wetland weeds covers both native and introduced species ranging from minor or localised environmental problems to those that should not be tolerated in any situation The author takes a pragmatic approach to weed control recognising that some weeds may not be possible to eradicate and emphasising the need to assess the extent and future potential of any infestation before taking action Weed control should be planned in the context of the overall management goals for any type of wetland the types of habitat weeds provide or overrun and whether they can be replaced successfully with more appropriate plants A range of strategies for controlling wetland weeds are considered from containment actions to prevent the development of a soil seed bank to physical removal and biological approaches from biocontrol to shading overplanting and use of turbidity The widespread use of chemical controls is also discussed with the warning that these are often only a short term cure and can cause more harm to aquatic ecosystems than the weeds they are holding at bay More than 130 species of established weeds are included with information on their origins nutrient responses environmental effects habitat values prospects for containment or eradication and even culinary uses Other sections look at native plants as weeds including a number of species of uncertain origins and
