Twilt, 1994-01 This design guide the fourth in the CIDECT series Construction with hollow steel sections deals with the fire protection of hollow steel section columns exposed to fire One of the major advantages of hollow section columns is to make fire protection possible by using methods other than the classic addition of materials on the external surface namely by water or concrete filling Not only the water cooled or concrete filled columns require markedly less space thus giving an appreciable increase in the usable volume but also they add to the slim and aesthetic appearance of the construction All three fire protection methods external protection by plaster asbestos or vermiculite as well as intumescent paints and coatings cooling by water static or circulating and concrete filling have been described in this book with design examples to make them easy to be applied by the user Back cover **Design Guide for Circular Hollow Section (chs) Joint Under Predominantly Static Loading** J. Wardenier, Y. Kurobane, J. A. Packer, 2003 **Design Guide for Rectangular Hollow Section (RHS) Joints Under Predominantly Static Loading** Jeffrey A. abstract Steel structures which are made of hollow section profiles are mainly used for construction structures There are many fields of applications for structures made of hollow section profiles Hollow section profiles are lightweight and have got a high resistance to compression which is an advantage for column structures The most common profile types have squared or circular hollow cross sections Connecting two or more pipes by welding the joints have got different shapes These joints are part of trusses or columns with a tree shaped optic The standards have got restrictions regarding the geometry material or load cases By choosing a node which is excluded in the standards designing engineers have to create their own models This thesis is about the designing of a Y shaped steel joint full overlapped on top connection which is not defined in current standards up to the time the thesis is created In this thesis only uniplanar joints are investigated A special focus is on the welding line which has got a three dimensional shape The aim is to figure out the influence on the inclination angle between the two members on the resistance of the joint Beside this the profile shape and profile thickness vary to see the differences in their resistance Square and circular hollow section profiles are in focus To analyse the behaviour of the different steel joints a numerical and experimental investigation is executed Design charts are created as a medium for designing engineers to calculate the ultimate resistance in the elastic and plastic state depending on the steel profile thickness and inclination angle The structure of the thesis is split into four main parts Firstly there is an explanation of the general topic with its difficultness Secondly there is the state of the art presentation of literature and standards in this range Thirdly there is a numerical analysis of the joints The basement of the numerical studies is detailed in pre studies which explain and compare different mesh types or geometrical variations Fourthly there is an experimental verification of the numerical tests It is figured out if the inclination angle increase the resistance of the steel joint will decrease significantly This effect is non linear Beside this it is found that the full overlapped joint with the squared profile has got a higher resistance than a comparable joint with a similar circular hollow section
