writing, ACS Lite supports 16 controllers in a single system. ACS Lite also supports Internet Protocol (IP)-based (Ethernet) communications.

ACS Lite monitors traffic signals by polling each controller on a per-minute basis for time-stamped state changes. If a poll request fails, the status report is still available from the local controller until the end of the minute, so the system has ample opportunity to poll again. This affords a measure of insulation from occasional communication errors, which can compromise systems that require per-second communications. In such per-second systems, a missed poll generally means a hole in the data that cannot be recovered once the 1-s polling window has passed. This appears to be particularly relevant in the context of wireless communications.

Vehicle Detectors

The detection scheme required by ACS Lite is compatible with typical layouts used for intersections under fully actuated control. This reduces the total cost to instrument a typical arterial as required for adaptive control. ACS Lite also incorporates detector processing in such a way as to be relatively flexible with respect to the size, location, and capability of detectors. This capability often reduces the need to resize or relocate existing loop detectors that are in the right location, but are not of ideal dimension. The demand measurement scheme also aims to address concerns that have been raised about the sensitivity of adaptive control performance with respect to precise detector count accuracy.
