Dynamic Models of Infectious Diseases Vadrevu Sree Hari Rao, Ravi Durvasula, 2012-11-07 Despite great advances in public health worldwide insect vector borne infectious diseases remain a leading cause of morbidity and mortality Diseases that are transmitted by arthropods such as mosquitoes sand flies fleas and ticks affect hundreds of millions of people and account for nearly three million deaths all over the world In the past there was very little hope of controlling the epidemics caused by these diseases but modern advancements in science and technology are providing a variety of ways in which these diseases can be handled Clearly the process of transmission of an infectious disease is a nonlinear not necessarily linear dynamic process which can be understood only by appropriately quantifying the vital parameters that govern these dynamics

Dynamic Models of Infectious Diseases V. Sree Hari Rao, Ravi Durvasula, 2013-11-30 Though great advances in public health are witnessed world over in recent years infectious diseases besides insect vector borne infectious diseases remain a leading cause of morbidity and mortality Control of the epidemics caused by the non vector borne diseases such as tuberculosis avian influenza H5N1 and cryptococcus gattii have left a very little hope in the past The advancement of research in science and technology has paved way for the development of new tools and methodologies to fight against these diseases In particular intelligent technology and machine learning based methodologies have rendered useful in developing more accurate predictive tools for the early diagnosis of these diseases In all these endeavors the main focus is the understanding that the process of transmission of an infectious disease is nonlinear not necessarily linear and dynamical in character This concept compels the appropriate quantification of the vital parameters that govern these dynamics This book is ideal for a general science and engineering audience requiring an in depth exposure to current issues ideas methods and models The topics discussed serve as a useful reference to clinical experts health scientists public health administrators medical practioners and senior undergraduate and graduate students in applied mathematics biology bioinformatics and epidemiology medicine and health sciences

Spatial Dynamics and Pattern Formation in Biological Populations Ranjit Kumar Upadhyay, Satteluri R. K. Iyengar, 2021-02-23 The book provides an introduction to deterministic and some stochastic modeling of spatiotemporal phenomena in ecology epidemiology and neural systems A survey of the classical models in the fields with up to date applications is given The book begins with detailed description of how spatial dynamics diffusive processes influence the dynamics of biological populations These processes play a key role in understanding the outbreak and spread of pandemics which help us in designing the control strategies from the public health perspective A brief discussion on the functional mechanism of the brain single neuron models and network level with classical models of neuronal dynamics in space and time is given Relevant phenomena and existing modeling approaches in ecology epidemiology and neuroscience are introduced which provide examples of pattern formation in these models The analysis of patterns enables us to study the dynamics of macroscopic and microscopic behaviour of underlying systems and travelling wave type patterns observed in dispersive systems Moving on to virus dynamics authors present a detailed analysis of different types models of infectious diseases including two models for influenza five models for Ebola virus and seven models for Zika virus with diffusion and time delay A Chapter is devoted for the study of Brain Dynamics Neural systems in space and time Significant advances made in modeling the reaction diffusion systems are presented and spatiotemporal patterning in the systems is reviewed Development of appropriate mathematical models and detailed analysis such as linear stability weakly nonlinear analysis bifurcation analysis control theory numerical simulation are presented Key Features Covers the fundamental concepts and mathematical skills required to analyse reaction diffusion models for biological populations Concepts are introduced in such a way that readers with a basic knowledge of differential equations and numerical methods can understand the analysis The results are also illustrated with figures Focuses on mathematical modeling and numerical simulations using basic conceptual and classic models of population dynamics Virus and Brain dynamics Covers wide range of models using spatial and non spatial approaches Covers single two and multispecies reaction diffusion models from ecology and models from bio chemistry Models are analysed for stability of equilibrium points Turing instability Hopf bifurcation and pattern formations Uses Mathematica for problem solving and MATLAB for pattern formations Contains solved Examples and Problems in Exercises The Book is suitable for advanced undergraduate graduate and research students For those who are working in the above areas it provides information from most of the recent works The text presents all the fundamental concepts and mathematical skills needed to build models and perform analyses

the world's growing population the provision of a safe nutritious and wholesome food supply for all has become a major challenge To achieve this effective risk management based on sound science and unbiased information is required by all stakeholders including the food industry governments and consumers themselves In addition the globalization of the food supply requires the harmonization of policies and standards based on a common understanding of food safety among authorities in countries around the world With some 280 chapters the Encyclopedia of Food Safety provides unbiased and concise overviews which form in total a comprehensive coverage of a broad range of food safety topics which may be grouped under the following general categories History and basic sciences that support food safety Foodborne diseases including surveillance and investigation Foodborne hazards including microbiological and chemical agents Substances added to food both directly and indirectly Food technologies including the latest developments Food commodities including their potential hazards and controls Food safety management systems including their elements and the roles of stakeholders The Encyclopedia provides a platform for experts from the field of food safety and related fields such as nutrition food science and technology and environment to share and learn from state of the art expertise with the rest of the food safety community Assembled with the objective of facilitating the work of those working in the field of food safety and related fields such as nutrition food science and technology and environment this work covers the entire spectrum of food safety topics into one comprehensive reference work The Editors have made every effort to ensure that this work meets strict quality and pedagogical thresholds such as contributions by the foremost authorities in their fields unbiased and concise overviews on a multitude of food safety subjects references for further information and specialized and general definitions for food safety terminology In maintaining confidence in the safety of the food supply sound scientific information is key to effectively and efficiently assessing managing and communicating on food safety risks Yet professionals and other specialists working in this multidisciplinary field are finding it increasingly difficult to keep up with developments outside their immediate areas of

expertise This single source of concise reliable and authoritative information on food safety has more than ever become a necessity Ordinary and Partial Differential Equations, Volume III B. D. Sleeman,1991 **Emerging Infectious Diseases** ,2004 *Population Biology of Infectious Diseases* R.M. Anderson,1982-10 for the design of control programs in extreme cases as discussed below by Fine et al this volume and elsewhere it can happen that immunization programs although they protect vaccinated individuals actually increase the overall incidence of a particular disease The possibility that many nonhuman animal populations may be regulated by parasitic infections is another topic where it may be argued that conventional disciplinary boundaries have retarded investigation While much ecological research has been devoted to exploring the extent to which competition or predator prey interactions may regulate natural populations or set their patterns of geographical distribution few substantial studies have considered the possibility that infectious diseases may serve as regulatory agents 1 8 On the other hand the many careful epidemiological studies of the transmission and maintenance of parasitic infections in human and other animal populations usually assume the host population density to be set by other considerations and not dynamically engaged with the disease see for example 1 2 With all these considerations in mind the Dahlem Workshop from which this book derives aimed to weave strands together testing theoretical analysis against empirical facts and patterns and identifying outstanding problems in pursuit of a better understanding of the overall population biology of parasitic infections For the purpose of the workshop the term parasite was defined widely to include viruses bacteria protozoans fungi and helminths **Journal of the Cameroon Academy of Sciences** ,2001 **Journal of the Royal Society Interface** ,2007 Understanding Your Health Wayne A.
