

LOCOMOTION AND MOVEMENT

Locomotion and Movement

Movement is defined as the movement of living organisms from one place to another; if the movement causes a change in location or position, it is called locomotion; such as walking, climbing, running, etc.

Kinds of Movement

There are three kinds of movement which are ciliary, amoeboid, and muscular.

- **Ciliary Movement:** This type of movement occurs in those organs which are covered with ciliated epithelium. It helps to capture dust particles that are inhaled during breathing and also helps to move the egg from the fallopian tube into the uterus.
- **Amoeboid Movement:** This type of movement can be seen in some immune cells, such as macrophages and white blood cells. It can also be seen in amoeba moving through pseudopods.
- **Muscular Movement:** Muscle movement is seen in the tongue, chin, limbs, etc. The muscles, bones, and nervous system are all involved in locomotion.

Kuznetsov,2015-03-13 This book offers a new explanation for the development of flight in mammals and offers detailed morphological descriptions of mammals with flapping flight The skeletomuscular apparatus of the shoulder girdle and forelimbs of tree shrews flying lemurs and bats is described in detail Special attention is paid to the recognition of peculiar features of the skeleton and joints For the basic locomotor patterns of flying lemurs and bats the kinematic models of the shoulder girdle elements are developed The most important locomotor postures of these animals are analyzed by means of statics The key structural characters of the shoulder girdle and forelimbs of flying lemurs and bats the formation of which provided transition of mammals from terrestrial locomotion to gliding and then to flapping flight are recognized The concept is proposed that preadaptations preceding the acquisition of flapping flight could have come from widely sprawled forelimb posture while gliding from tree to tree and running up the thick trunks It is shown that flying lemur is an adequate morphofunctional model for an ancestral stage of bats The evolutionary ecomorphological scenario describing probable transformational stages of typical parasagittal limbs of chiropteran ancestors into wings is developed *The Use of Modules in College Biology Teaching* Joan G.
