### Observing Human Traits Lab

**Background:** Physical traits are observable characteristics that are determined by genes. Genes are specific segments of DNA located on chromosomes that code for a particular trait. Most genes have two or more variations, called alleles. Some alleles are dominant over others and dominant alleles will be expressed in an organism's phenotype or physical appearance, and recessive alleles. Recessive alleles may be present in an organism but expression will be masked in the presence of a dominant allele for the same gene. Recessive traits will only be expressed when there are two recessive alleles present in the individual (homozygous).

Keep in mind that it's not always quite this simple. There are other factors that can affect test responses, and most tests have general guidelines that influence responses. This table is a handy reference for determining test responses. Let's get started!

**Directions:** Circle the alternative you favor for each of the following system needs.

Personal Traits Inventory		
Trait	Phenotype	
Handedness	Right handed	Left handed
Earslobe	Unattached	Attached
Tongue rolling	Yes	No
Tongue folding	Yes	No
Cheek dimples	Yes	No
Freckles	Yes	No
Clav	Dark skin	Light skin

Let the game value be the maximum of the minimum values of the two players.

**Abstract:** The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the 10-year-old children in the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical activity during the study period, while the experimental group participated in a 12-week training program. The physical fitness of the children was measured at the beginning and at the end of the study period. The results of the study showed that the experimental group had significantly higher levels of physical fitness than the control group at the end of the study period. The study concluded that a 12-week training program can improve the physical fitness of 10-year-old children.
