Delphi enables you to create robust database applications quickly and easily. Delphi database applications can connect directly to the following databases: Borland Paradox, dBase III, dBase IV, Microsoft Access, and Microsoft Visual FoxPro. The Delphi database components also work with various database servers such as Oracle, Sybase, Microsoft SQL Server, Informix, InterBase, and ODBC data sources. Delphi client applications can be used equally between relational and flat-file data-based client/server architectures, and from client/server or a single machine.

This chapter introduces Delphi's database tools, including the Data Access and Data Components component groups, the Table Editor, the Database Explorer, and the Database Administrator.

What you should know first

For Delphi, a database application is similar to that of any other Delphi application. This book assumes you understand the basic application development techniques covered in the Delphi 3 User's Guide, including:

- Creating applications using project files
- Creating forms and integrating them
- Creating and using menu commands, properties, and events
- Creating applications that use Visual Basic components

You also need to have some understanding of the Database Manager used by the rDBMS you're developing database applications against, whether it is a desktop database such as dBase or Paradox, or an SQL server. For information specific to building database applications with the Delphi database components, see Chapter 6, "Developing Database Applications."

This book assumes you have a basic working knowledge of database database design, relational database design. There are many other topics that are covered in this book, but they are not covered in this book.
