**Web Application Vulnerability Assessment Tools Analysis** Ajinkya Wakhale, 2018 In this era with plethora of web applications and increasing amount of consumers using web applications for different purposes it becomes very important to protect them from several web vulnerabilities present on the INTERNET Web applications process large amount of data which they store it in a back end database server where confidential data like username password credit card information sits Web applications usually interacts with customers and there is huge

dependencies between customers and the server and this dependency introduces huge security holes which can be exploited by a hacker to steal the data 16 The most common way to find vulnerability in the web application is to perform Vulnerability Assessment and Penetration testing VAPT on web application According to OWASP 16 the most efficient way of securing web application is to manual code review The drawback of doing manual review is that it requires expert skills and it is very time consuming and hence enterprises uses automated tools to scan the systems and find vulnerabilities in them Web application scanners are automated tools that scans the web application to detect unknown vulnerabilities in the application This technique is usually referred as Dynamic Application Security Testing There are several tools available in the market that does security testing on web applications and gives you detailed report on all the security loopholes present in the system 16 It requires deep insight and understanding to deal with web application security not because of the many tools that are available but because it is still in nascent stage Hence it becomes really important to find proper tools to scan the web applications and find vulnerabilities present in the system Most tools available in the market both open source and paid commercial confines themselves to the specific set of vulnerabilities in which they are expert For example some tools are best designed to find SQL injection in the system while some are good in finding cross scripting or CSRF Hence it becomes important to find the right tools which takes into the consideration of development environment needs and most importantly web application complexity This research propose a detailed report on some of the most commonly used tools in the market and their efficiency in finding out the vulnerabilities in the web application and the technique they used to find out the security loopholes present in the application We discuss several efficient tools along with their advantages and disadvantages techniques they use and most importantly their efficiency to detect vulnerabilities in the application It evaluates all the tools and give recommendation to the developer and user of the web application It also analyzes whether the development and hosting environment of the application affects its security or not
