

Human Blood Cell Typing

What did you learn?

What?

Antigen-antibody reactions in human transfusions are often deadly and so every transfusion laboratory always screens donors with red blood cell agglutination tests. Blood is not just a simple substance and there are many factors for transfusion. Rh factor and blood cell typing are things that are not always taken into account when blood is transfused. The blood cell typing tests are used to determine if a person's blood is compatible with the donor's blood.

Activity 1 – Red Blood Cells and Antibodies

	Person with Blood Type A	Person with Blood Type B	Person with Blood Type AB	Person with Blood Type O
Cellular attached antigens				
Antibody produced				
Cells in the plasma of blood transfused				
Cells in the plasma of blood received				

1. Blood is not a simple substance and so every transfusion laboratory always screens donors with red blood cell agglutination tests. Blood is not just a simple substance and there are many factors for transfusion.

a. According to Activity 1, (person with blood type AB) should be the best transfusion choice.

What did you learn?

a. When donor blood is transfused to recipient, it is agglutinated.

Antibodies

a. When donor blood is transfused to recipient, it is agglutinated.

Agglutination is the process of clumping of red blood cells. It is a result of the reaction between the antibodies and the antigens on the surface of the red blood cells.
