

Human Blood Cell Typing

What did you learn?

What?

Antigen-antibody reactions in human transfusions are often deadly and so every transfusion laboratory always screens donors with the most powerful human antibodies for the traits in our next assignment. Donors and their red blood cells for transfusion, Rh factor and blood cell typing, are being prepared so that red blood cells from donors are kept and cells with the donor's blood can be destroyed.

Activity 1 – Read Blood Cells and Antibodies

	Person with Blood Type A	Person with Blood Type B	Person with Blood Type AB	Person with Blood Type O
Cells with attached antigens				
Antibody produced				
Cells to the person's red blood cells				
Cells to the person's red blood cells				

1. Blood type A donor, transfused with blood from a B person, would cause an antigen-antibody reaction.

2. According to Activity 1, (person's) blood type can be used to determine whether

blood is safe.

3. When donor blood is transfused to a recipient,

antibodies

4. When transfused, a type A red blood cell from a type B red blood cell

type A and B antibodies in the recipient's blood will destroy the donor's red blood cells.
