EBOOK: Calculus: Early Transcendental Functions Robert T Smith, Roland Minton, 2011-02-16 Students who have used Smith Minton's Calculus say it was easier to read than any other math book they've used. That testimony underscores the success of the authors' approach which combines the best elements of reform with the most reliable aspects of mainstream calculus teaching resulting in a motivating challenging book. Smith Minton also provide exceptional reality based applications that appeal to students' interests and demonstrate the elegance of math in the world around us. New features include: A new organization placing all transcendental functions early in the book and consolidating the introduction to L'Hôpital's Rule in a single section. More concisely written explanations in every chapter. Many new exercises for a total of 7 000 throughout the book that require additional rigor not found in the 2nd Edition. New exploratory exercises in every section that challenge students to synthesize key concepts to solve intriguing projects. New commentaries Beyond Formulas that encourage students to think mathematically beyond the procedures they learn. New counterpoints to the historical notes Today in Mathematics that stress the contemporary dynamism of mathematical research and applications connecting past contributions to the present. An enhanced discussion of differential equations and additional applications of vector calculus.

A First Course In Partial Differential Equations J Robert Buchanan, Zhouda Shao, 2017-10-30 This textbook gives an introduction to Partial Differential Equations (PDEs) for any reader wishing to learn and understand the basic concepts, theory and solution techniques of elementary PDEs. The only prerequisite is an undergraduate course in Ordinary Differential Equations. This work contains a comprehensive treatment of the standard second order linear PDEs: the heat equation, wave equation and Laplace's equation. First order and some common nonlinear PDEs arising in the physical and life sciences with their solutions are also covered. This textbook includes an introduction to Fourier series and their properties, an introduction to regular Sturm-Liouville boundary value problems, special functions of mathematical physics, a treatment of nonhomogeneous equations and boundary conditions using methods such as Duhamel's principle and an introduction to the finite difference technique for the numerical approximation of solutions. All results have been rigorously justified or precise references to justifications in more advanced sources have been cited. Appendices providing a background in complex analysis and linear algebra are also included for readers with limited prior exposure to those subjects. The textbook includes material from which instructors could create a one or two semester course in PDEs. Students may also study this material in preparation for a
