Tanveer Anwar,2008 *Data Processing on FPGAs* Jens Teubner,Louis Woods,2022-05-31 Roughly a decade ago power consumption and heat dissipation concerns forced the semiconductor industry to radically change its course shifting from sequential to parallel computing Unfortunately improving performance of applications has now become much more difficult than in the good old days of frequency scaling This is also affecting databases and data processing applications in general and has led to the popularity of so called data appliances specialized data processing engines where software and hardware are sold together in a closed box Field programmable gate arrays FPGAs increasingly play an important role in such systems FPGAs are attractive because the performance gains of specialized hardware can be significant while power consumption is much less than that of commodity processors On the other hand FPGAs are way more flexible than hard wired circuits ASICs and can be integrated into complex systems in many different ways e g directly in the network for a high frequency trading application This book gives an introduction to FPGA technology targeted at a database audience In the first few chapters we explain in detail the inner workings of FPGAs Then we discuss techniques and design patterns that help mapping algorithms to FPGA hardware so that the inherent parallelism of these devices can be leveraged in an optimal way Finally the book will illustrate a number of concrete examples that exploit different advantages of FPGAs for data processing Table of Contents Preface Introduction A Primer in Hardware

,2006 Current SRAM FPGAs have reached high gate densities which make them suitable for portable reconfigurable systems and data intensive applications However some challenges need to be faced to make this become a reality First due to a large number of transistors for field programmability and low utilization rate of FPGA resources existing FPGAs are highly power hungry compared to ASICs As chip technology progresses to 90 nm and below this situation becomes worse and static current plays a major role in the total power Second the present column based configuration structure is not flexible enough for applications with multiple reconfigurations Unnecessary memory bits have to be configured if the layout of the module does not fully occupy the height of the device and consequently introduces wastage of time and energy Third the global clock distribution over the whole chip results in a very high power consumption Even when some parts of the hardware resources are not used the whole clock line must be switched at every clock cycle Finally current FPGAs can not support bus routing structure The implementation of data intensive applications using traditional bit based routing tracks will require more routing resource and produce higher power consumption A lot of previous efforts have been made on FPGA power modeling and power reduction In the work of power modeling and estimation for SRAM FPGAs none of them has considered the impact of inrush current and configuration current which can not be neglected for low power applications that need multiple reconfigurations For the previous power reduction architectures some of them considered either one of dynamic power reduction or static power reduction The other architectures such as dual Vdd FPGA architecture considered both dynamic power and static power reduction But their implementations produce significant area and configuration time overheads and the power management strategy is very inefficient since it is based on fine grained logic blocks or routing switches The complex power management makes these architectures not practical for the real time applications that need multiple dynamic reconfigurations This thesis proposes a battery aware tiled FPGA architecture for data intensive computations The architecture is globally coarse grained in terms of FPGA tiles and locally fine grained in terms of configurable logic blocks within each FPGA tile The main feature of the architecture is that the power supply to each tile can be turned on off depending on the computational requirements and system load The static control strategy is fairly simple which makes the area and configuration time overheads relatively small The architecture adopts a two level configuration structure column based programming and fully random access programming which can efficiently reduce the configuration time and energy while keeping the overheads of pin count and area relatively small This combined configuration architecture enables the easy task relocation from one tile to another The top level routing architecture between tiles is a combined bus based and bit based routing structure which is very efficient for data intensive applications A simulation platform is built with NetLogo to evaluate the proposed architecture Besides dynamic and static currents inrush and configuration currents are also

considered The static control function is implemented in the platform to reflect the main feature of the architecture which is the coarse grained power supply control strategy Experimental results on some randomly generated task graphs and a JPEG encoder show that 1 tradeoff between execution time and power battery usage can be achieved by using different number of tiles in the architecture 2 significant savings in battery energy cost can be achieved by using the static control function provided by the architecture 3 by varying the architectural parameters of the tiled FPGA more savings in battery energy cost could be obtained

Architecture and CAD for Deep-Submicron FPGAs Vaughn Betz,Jonathan Rose,Alexander Marquardt,1999-03-31 Architecture and CAD for Deep Submicron FPGAs addresses several key issues in the design of high performance FPGA architectures and CAD tools with particular emphasis on issues that are important for FPGAs implemented in deep submicron processes Three factors combine to determine the performance of an FPGA the quality of the CAD tools used to map circuits into the FPGA the quality of the FPGA architecture and the electrical i e transistor level design of the FPGA Architecture and CAD for Deep Submicron FPGAs examines all three of these issues in concert

Field-Programmable Gate Arrays John V. Oldfield,Richard C. Dorf,1995-01-23 Due to unique advantages like security improved testing and reprogrammability field programmable gate arrays are making broad inroads in the electronics industry This comprehensive overview of the topic explains the underlying principles strengths and limitations of a range of FPGA architectures Includes abundant references and illustrations

Optimizing FPGA Architecture for Deep Learning Workloads Aman Arora,2023 Deep Learning DL applications have tremendous computation requirements making running them on traditional computers CPUs very inefficient Modern computer systems deploy hardware acceleration which involves offloading compute intensive and memory intensive tasks to specialized hardware In the space of hardware acceleration alternatives Field Programmable Gate Arrays FPGAs lie in the middle of the programmability efficiency spectrum with Graphic Processing Units GPUs being more programmable and Application Specific Integrated Circuits ASICs being more efficient FPGAs provide massive parallelism and are reconfigurable which makes them very well suited for the fast changing needs of DL applications However the generic building blocks available on traditional FPGAs limit the acceleration that can be achieved Hence FPGAs trail ASICs by an order of magnitude in terms of performance So how can the gap between ASICs and FPGAs be minimized while retaining the strength of FPGAs the reconfigurability This dissertation describes research that aims to find the answer to this question by proposing new domain optimized FPGAs for Deep Learning The key idea is to integrate new hardware blocks to the FPGA that provide domain specialized functionality while still keeping them largely general and allowing them to be used with traditional FPGA flows Specifically new DL optimized FPGAs containing blocks called Tensor Slices and CoMeFa RAMs are presented The architecture of these blocks along with the tradeoffs in exploring their architectures is explained Results show that significant performance improvement and energy reduction can be obtained for DL applications by using DL specialized FPGAs containing these blocks New benchmarks called Koios developed

to explore FPGA architectures for DL are also explained These benchmarks are open sourced and work with VTR an academic open source FPGA architecture exploration tool New DL optimized FPGAs containing Tensor Slices and CoMeFa RAMs are significantly more efficient at accelerating DL workloads while still being reconfigurable at a fine grain With the abundance of DL applications making DL optimized FPGAs is an attractive proposition
