2. Systematics- the study of diversification of living forms in the past and the present. It includes the overall study of the organisms identification and classification.
3. The hierarchical classification of taxonomy is the official organism nomenclature that includes its kingdom, phylum, class, order, family, genus, and species. It helps group and classify organisms.
- 4.

5. A sister taxa is the pairs of terminal clades that branch from a common node and are closely related on the tree.
6. A rooted phylogenetic tree is when one branch of the tree corresponds to the most common ancestor of all the species on the tree.
7. A basal taxon is the lineage of a species displayed in a phylogenetic tree that has evolved early from the root and has no other diverging branches coming from it.
8. The differences between homologies and an analogy is analogous structures are inherited from a different precursor while homologous structures develop from related embryonic substances.
9. Cladistics are when organisms are grouped based on their most recent common ancestor. A clade is a group of organisms that share common ancestor past or extinct.
10. A monophyletic group contains ancestors in all of its descendants. A paraphyletic group contains an ancestor but some of its descendants. A polyphyletic group contains various organisms with no recent common ancestors.

*Foundations of Phylogenetic Systematics* Johann Wolfgang Wägele, 2005 Phylogeny inference and the classification of organisms are indispensable for all fields of biology On the basis of a well corroborated tree of life it is possible to understand the evolution of structure and function of genomes of gene families of cascades of developmental genes and the origin of genes of medical importance Ecologists need a stable classification of

organisms to identify organisms to find their correct names and thus further information on relevant species This book offers an introduction to the theory of Phylogenetic Systematics and is a companion for all biologists who want to analyze morphological or molecular data with classical methods or with modern computer programs The first part of the book explains the epistemological basis that is independent of the type of method used to construct phylogenetic trees Unlike other empirical sciences the estimation of data quality in phylogenetics is still little developed and very often neglected Here a theoretical basis is presented that enables the systematist to assess critically and objectively the quality of different data sets and to make statements on the plausibility of results This requires a conception of the notions of information content probability of homology probability of cognition probability of events the principle of parsimony the differentiation of phenomenological and modelling methods Willi Hennig's original method is compared with modern numerical systematics and an updated Hennigian procedure of data analysis is discussed The difference between phenetic and phylogenetic cladistics is explained Popular tools for data evaluation implemented in computer programs are explained including their axiomatic assumptions sources of error and possible applications For the more common tools the mathematical background is explained in a simple easy to understand way Johann Wolfgang Wägele was until recently head of the Department for Animal Systematics Lehrstuhl für Spezielle Zoologie at the University of Bochum and is now director of the Museum Alexander Koenig in Bonn Germany His main research interests are the taxonomy phylogeny and biodiversity of Isopoda which implies observations of life history biogeography and ecology in combination with phylogeny inference Further subjects include arthropod phylogeny and tools for explorative data analyses The author is president of the Gesellschaft für Biologische Systematik a Central European society of systematists and he is actively promoting biodiversity research
