Exploring the Periodic Table

WHY BOTHER?

As you read this section, keep these questions in mind:

- What are the three basic categories of elements?
- Why do the elements in the same group have similar chemical properties?
- What happens to all atoms that have the same no. of protons?

What Do Elements in a Group Have in Common?

All of the elements in a group (also called vertical column) have similar properties. Overall they all exhibit chemical reactivity as a result of valence energy levels. The electrons in the outermost energy level are called valence electrons. The number of valence electrons in an atom determines many of the chemical properties of an element.

In general, the atoms of elements in the same group have the same number of valence electrons. For example, lithium (Li) and sodium (Na) are both members of Group 1, all atoms of these elements have one valence electron. Because of this, lithium and sodium have similar chemical properties.

Lithium and sodium have one valence electron in common. How does this affect the chemical properties?

PERIODIC TRENDS

Remember, the periodic table is the grid of the elements. Each vertical row of the periodic table is called a group. Each horizontal row of the periodic table is called a period. What trends can you observe in the periodic table?

LOCK-UP-CLOSE

1. Complete these open the element sections on atoms and valence electrons.

The repeating patterns of chemical properties occur in the periodic table are called periodic trends. Periodic trends are a result of the arrangement of electrons in atoms of each element.
