

CONCEPTS

A function f from a set A to a set B is a rule that assigns to each element x in A exactly one element y in B . We write $f: A \rightarrow B$. The set A is called the domain of f and the set B is called the codomain of f . The image of x under f is denoted by $f(x)$. The set of all images of elements in A under f is called the range of f .

A function f is called injective (one-to-one) if different elements in A have different images in B . A function f is called surjective (onto) if every element in B has at least one pre-image in A . A function f is called bijective (one-to-one and onto) if it is both injective and surjective.

A function f is called increasing (strictly increasing) if $x < y$ implies $f(x) < f(y)$. A function f is called decreasing (strictly decreasing) if $x < y$ implies $f(x) > f(y)$. A function f is called non-increasing (non-decreasing) if it is either decreasing (increasing) or constant.

A function f is called even if $f(x) = f(-x)$ for all x in the domain of f . A function f is called odd if $f(x) = -f(-x)$ for all x in the domain of f .

and or resources can be devoted to the warehouse update Hence we have developed new techniques to ensure that the warehouse update can be done efficiently Also the warehouse update is not devoid of failures Since only a limited amount of time and or resources are devoted to the warehouse update it is most likely infeasible to restart the warehouse update from scratch Thus we have developed new techniques for resuming failed warehouse updates Finally warehouse updates typically transfer gigabytes of data into the warehouse Although the price of disk storage is decreasing there will be a point in the lifetime of a data warehouse when keeping and administering all of the collected data is unreasonable Thus we have investigated techniques for reducing the storage cost of a data warehouse by selectively expiring information that is not needed
